Villy,

I haven't seen an answer to your RTTY vs AM power question, so here's mine:

The PEP of CW and RTTY is the same -- 100% constant. The PEP of SSB varies with your voice syllables. AM's PEP is 4x average.

I've been told (here) that the finals and power supply to them is quite sufficient to run your CW and even RTTY at 100 watts, but I know the PEP output of the finals is not enough for AM. There used to be an article in the ARRL handbook about AM linear amplifiers and why they had so low carrier output -- it is the same here.

I can't help with the rasp. I trust the open heart surgery fixed the murmur.

My concern is with the ability of the TS-850 to manage continuous output at 100 watts. RTTY is the equivalent of CW key down for however long you are transmitting.

That was my concern. In the old AM days, there was no question, nothing was worse than AM.

So the question is : can the finals in the TS-850 handle full power key down for extended lengths of time ??

Yes, the surgery seemed to have fixed the raspy signal - strange that vco2 is the only one that seems to suffer from this problem - since there are 4 other vcos in the box using that same type of trimmer - and no=one seems to have much trouble with them.

10124. Re: no s-meter deflection while rx (TS-850)

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-01-11 20:29:16 UTC
From: david broger
Topic: 9957 Message: 10124

When I give the signal of the XG2 (50uV) to CN1 (input of the rf board) then I get with the 2.7kHz filter S9. This make sense. So the problem shuold be between antenna connector an input rf board.

Hi Steve!
Villy, I never owned a TS-850 but have owned three TS-870s. I have
operated the TS-850 in RTTY contests at full power and you can key it
for long periods of time.
Joe, K0BX, has used TS-850s on RTTY for years. Google his call. I
think he has a website.

Hi all,
Keep in mind that in the AM mode there is 50 watts allowed in the carrier...their will be an equal amount in the sidebands with 100 percent modulation. This is almost the same as the RTTY at 100 watts. Just have to be certain the rig stays cool in the RTTY or AM modes.

Hi and a happy new year!

I checked IC1 (according message 9726) and this seams to be ok. I checked every diode and they are ok.

I checked q49 too. The collector voltage is about 11.8V and txb is 0V. Q49 seams to be ok.

I compared the rx sensitivity with my old TS-830. I used the XG2 from Elecraft. TS-830: 50uV gives S9 and 1uV no S-meter deflection but is clear herable. Compared with the TS-850: 50uV gives about S5-6 and 1uV is very low herable. This means there is definitvly somthing wrong. The good side: the TS-850 receiver is very noiseless.....(but I like to have a little bit more noise...)

Hi Bob
50uV should give s9.
I supposed the problem is on the small filter board X51 B/3. But this board semas to bo ok.
I measure 50kOhm on the antenna connector.

Question to the experts:
When you have 50uV at the antenna connector. How mutch do you have at the CN6 connector?

50uV at CN6 gives me S9. 50uV at the antenna connector gives me about S4. Make this sense?

The s-meter on an 850 is set for 20uV = S-9. 50 uV should be 8dB over S-9.

On the small filter unit board replace C24, C25, C26, C27 after making sure the relay is working correctly.

Hello!

I have a TS-450SAT which has suffered an accident, resulting in an smashed front panel. Everything else is perfect but the front panel, including display, is gone. I would like to fix it, so I need a complete front panel or even a parts unit with a good front panel. Any luck ;-)?

Thanks and best regards,

JOSE

10133. In rad 2.1 khz filters and slope tuning

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-01-14 03:58:14 UTC
From: villy.madsen
Topic: 10133 Message: 10133

I thought that I had a problem, then I thought I didn't and now I am almost sure that I do....

symptoms...

I have the inrad filters in the 270hz slot (for the 8.83 mhz one) and the 455 in the only available (500hz) slot.

in USB, LSB & FSK using the inrad filters everything works as I think it should. I can play with the slope knobs to my hearts content - getting a nice narrow passband.

on CW - If I use the builtin 2.7 khz filters it works much as expected - I can narrow up the pass band & by tweeking the knobs - move the passband up & down in freqency.

If I use one of the 2.1 khz inrads & a 2.7 khz - ditto although the slope knobs can be slightly to way off centre depending upon the pairs of filters being used.

If I select both of the inrad filters, the slope tuning has little if any effect (in all of the other cases - by mistuning the two slope tuning knobs, I can kill the signal completely)

Other symptoms. With the 2.7 khz filters selected, by mistuning the slope knows I can reduce the signal to almost nothing in lsb,usb,fsk - cw reduces a lot, but not to the same extent

With the inrad 2.1s - same for everything except CW...(no noticeable change there at all. AGC is turned off.

Any Thoughts ??

Clif Thank you for the info for repair, i already repaired the 850 receiving AM broadcast, its the rls135 diode. The diode is shorted and another is leaking. Also another 850 of my brother with attenuated rx, only average signal is coming in, but the weak that other radio can pick up is attenuated. Also the rls135 is the problem, I replaced 2 rls135 diode on each radio on the RF board. Again thank you, Alex DV1TBX --- In TS-850_450_690@yahoogroups.com, "avvidclif" wrote: > > Replace the leaky diode, all your tests confirm it. > > Clif > > --- In TS-850_450_690@yahoogroups.com, "Alex" wrote: > > > > Thank you Clif for the info,its a big clue whats going on the radio. Heres another question for this issue, the 850 was tested to another loaction and the broadcast station were not heard there but when it was returned or used to the original location it can pick up the broadcast. What iam trying to point is if the diode is shorted on the RF board will it still rx good or ok when far from the broadcast station? For sure the original location is near the a broadcast station. So it is over loading the frontend when near? The broadacst audio were mix on rx audio on all the band. Any advise for this situation? > > > > Also another 850 were tested near the broadcast station and its not getting any broadcast station. Thats why we can say there is a problem with the other 850. > > > > Thank you for your good advise it helps me alot. and now problem solved!
I replaced C25 and now all is ok! 50uV gives me S9+15-20dB.

Hi everyone, I tried searching for my problem and could not find anything that covered all point at the same time.
I turned my 850 on yesterday, and heard a faint signal of interest, so I went to turn up the volume, and discovered that it was already up at 1/2 travel. I also noticed that the S meter was "stuck" on S8 and did not vary with signal, or band change. I am not sure if it may be AGC related, because when I switch from "slow" to "medium", there is a burst of almost normal level volume and the S meter swings normally. Then after about one second it reverts back to it's previous behaviour. Going from "medium" to "fast" of "off" makes no difference, it only happens on the "S" to "M" change.
I am hoping that someone has seen this behaviour before and will know the fix.
Thanks in advance,

Chris VK7HCH

Where is your RF gain control set? This is the exact symptom of the RF
gain control not being fully CW.

Hi All
I have purchased a TS-450SAT that puts out 150w on all bands plus the ALC fires across the screen even on a very low mic gain(1/2 mark with processor)I have a copy of the service manual, is there an easy fix to bring it all back to approx 100w and without overdriving the ALC.
I luv the radio but i want it to last a for a while!!
Many thanks

Topic: 10142 Message: 10143

Sounds like someone performed the high power mod...
To fix this, you will need a small phillips screw driver, a dummy load and optionally a watt meter.
Now navigate to Files, Alignment FAQ's, TS-450S, More than 100 Watts.
This if in the "files" section in this group...

Basically, you want to adjust VR15 so that the right most "dot" on the ALC meter is just flickering on all bands.

Mine is happy right at 125W. As long as you have good ALC, then it should be fine as is.

10144. TS450S ALC meter

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-01-17 21:55:48 UTC
From: fcp_lopes
Topic: 10144 Message: 10144

Hello everyone I've searched the forum and although similar but I find no problem exactly like mine so I decided to put this post.
I have a TS450S with the following problem:
ALC indicator is almost always in full scale when not in full scale does not move, at the same time the power drops from 100W to 5W or less.
I got the service manual on the internet and through some tips from the forum found that the ALC voltage was not correct which I set and I think that the power is in accordance with the signal injected into the mic, I made several QSOs and power held constant, stable at about 100w but I notice that the ALC indicator is always in full scale even with the low Mic/Gain. I tried to calibrate the ALC meter as shown in the service manual, but I can not adjust the level because when turn Mic/Gain the ALC meter goes to full scale and is impossible to calibrate.
Would appreciate help for solving this problem
Thanks in advance.

CT1FAC / Fernando

Hi fellas,
I replied the other day, but it never showed up.
I went and checked the RF gain the following day, it was fully CW as it normally is.
When I powered up, everything was as normal. S meter deflection, volume level etc...
The only difference was the humidity level. I am serious, the day it played up the humidity was about 85%. I originally thought I had a wet speaker cone.
So it looks like condensation / moisture somewhere in the AGC circuit or across the RF gain control wiring simulated the symptom of decreased RF gain.

Thanks again, chalk this one up to experience.

Fernando, I'm not sure about the 450 but on the 850 the ALC meter can be used via the CAR control in CW mode. Is your 450 the same? If so, how does it work in CW mode?

The ALC meter on the 450 is set in the alignment menu and requires an audio generator with a calibrated output or at least a method of setting the audio level to 1000Hz @ 5mv and 10mv level.

Hi Clif

after entering in calibration mode, according to the Service Manual when I inject the signal of 1kHz/5mV and try to set the ALC meter for one dot ligth, simply does not show anything or is at full scale, impossible to adjust, the same goes for the other signal generator of 1kHz/10mV and 1kHz/20mV.

Thanks

Ct1fac / Fenando

Set the Mic VR for just as it gets to max output without the ALC moving and go thru the alignment. Then do it several more times. When it's AFU from someone playing it's hard to get it back.

Could I get someone to look at the black antenna relay on the filter board and give me the Matsushito part number on it? Mine needs replacing, but part of the number is rubbed out. I have a source for the relays and just need to know the right number. Kenwood wants too much for them. Thanks.

O.k., now I'm looking for a source for D11 on the Filter Board; the part number is DSA301LA. It's surge suppressor. Anyone know where to get one? I've not ever ordered from Kenwood, so don't know if they would have it in stock or not. Thanks.

10157. New rig I'd like to check out

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-01-19 22:26:23 UTC
From: VA3UE
Topic: 10157 Message: 10157

Hi gents,

I just bought TWO TS-450S/ATs on eBay. One arrived today and I expet the other tomorrow. As with any electronics it's nice to know if it is functioning as it should.

I am planning on sending them both in to hamrepair.com in Carollton to have them checked soon, but it would be nice to give a go in an existing shack. I don't know this radio well enough to know what to check for.

Is there somebody in the Rockwall, Garland, Dallas, Plano, Frisco area (preferably another TS-450S/950S) that might allow me to bring one or both of these over and see how they measures up against a known good setup?

Thanks in advance!

From: VA3UE
Topic: 10158 Message: 10158

TS-450S questions again. Sorry, new to this rig.

One of the pair of these I bought comes with the 2.4 KHz SSB filter in the 8830 KHz IF section. The manual and the guy who sold it to me lists it as a YK-88S-1.

I'm looking for another one of these for the other TS-450S whici doesn't have any filters in it. I've been shopping around and I see YK-88S filters (no "-1" suffix) saying thee are for TS-430/440 and another listing mentioning soldering them in.

So are the YK-88S-1 and YK-88S the exact same or is one a solder and the other plug in version?

Thanks in advance

Daniel

I think the YK-88S was made for the TS-830S, etc. and is solder in. The
YK-88S-1 in the plug-in. The YK-88SN-1 is the 1.8 KHz plug-in.

Hello all,

Beware with one detail... it is NOT the same the YK-88S-1 than the YK-88S1. The later is a solder in 2.6kHz filter, used in the TS-940 among others (I know as I just replaced one :-))

I have found some info here... there is even an YK-88S2:

http://jg1xlv.jp-au.net/yk88s2.htm

Best regards,

JOSE

10162. TS-450 TX power

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-01-21 00:01:33 UTC
From: cintrans
Topic: 10162 Message: 10162

Hi all

My TS-450Sat developed another glitch.

While transmitting (CW or SSB) the power sometimes falls back from the normal 100w to about 50w. I noticed this especially on the bands from 17m up to 10m and when the radio has been on for some time (radio warmed up)
When the power drops down, there is no ALC reading at all.
To get the power back to normal i either have to play with the carier (for CW), the mic (for SSB), the pwr, TX into a high SWR or momentary swith S1 on the IF board for 50w and back to normal... changing band or mode sometimes does the trick allso... then it will TX for a few key ups back at full power...
Anyone with any tips on where i should start looking to solve this glitch??

The YK-88S is a solder in filter. The YK-88S-1 is a plug in. It is reported by users that they are the same filter. In fact, there is one post that says you can remove the filter from the board and solder it in a TS-430/530, etc.

Steve, N4JQQ,

The YK-88SN-1 is listed as an optional filter in the TS-450/850 manuals but there is no mention of the YK-88S-1.

This this:

From: n4dtf
Topic: 10166 Message: 10166

Be easy with me, I am new to the whole CAT process. I bought the cable from HoseNose and, with the help of a USB/Serial converter, have successfully gotten my VQlog and N1MM software to talk to my rig. Frankly, seeing the frequency change when I turn the tuning knob was a big deal for me. Just the help with contest logging will be awesome.

Here's my question . . . beyond rig control, can I also use this interface for digital modes, keyboard CW, etc, or will that require a separate sound card interface? I note that my rig has an FSK-441 setting . . . does that mean I can drive it via this interface?

Insight from those of you who have already paved the way is greatly appreciated.

Date: 2011-01-21 15:49:06 UTC
From: Jordan
Topic: 10167 Message: 10167

I have my 850S running LP-Pan with excellent results so far, but I cannot get VAC (registered version) to feed the I/Q out from PowerSDR-IF.

As soon as I hit the VAC button, Psdr-IF crashes.

Is there someone using this setup that could go over their settings with me..?

Thanks....Jordan VE6ZT

Topic: 10166 Message: 10168

There is many ways to make digital and CW work, in general, there are two ways FSK and AFSK. I have been involved in digital since 1971 and have used them all, but suggest AFSK to because it is so much easer for someone new. This would require two audio connections (TX and RX) between your radio and computer. I feel the best way is to forget all of the commercial stuff and home brew a audio connection with audio padding in between. It is easy and is explained in your N1MM logging software help instructions. The N1MM comes with the digital and CW modes included. The N1MM instructions is indexed and you can click right to what you need. Hope this helps.

That will depend on which cat interface you bought. Some high end cat devices also do the sound card . The Kenwood if232c will not do both...they WILL do the ptt line, but the device needed for sound card software is a different device normally

Hi Trent

Usually you need a small interface to use for digital. They are very simple to make, or you can purchase many different ones that are available. You can also do a Google for G4ZLP. He makes some really good interfaces for the Kenwoods.

K4ABT makes some great RASCAL interfaces. I have 3 of them here. I use 2 of them on my TS-450SAT's and one on my Yaesu. You have to figure what mode you are going to use before getting one. He makes them for either FSK or AFSK. FSK is good because it allows you to use your CW filters in the FSK mode. Problem is most software packages that do a lot of different digital modes use AFSK, not FSK. Then you are at the mercy of your SSB filters.

If you are just going to do RTTY, MMTTY is a great software package (and it's free). N1MM Logger is a great contesting software (also free). N1MM and MMTTY work very well together. N1MM will also work with FLDigi and MMVARI for other digital modes. 73 and have fun on RTTY.
Tom W7WHY

Be easy with me, I am new to the whole CAT process. I bought the cable from HoseNose and, with the help of a USB/Serial converter, have successfully gotten my VQlog and N1MM software to talk to my rig. Frankly, seeing the frequency change when I turn the tuning knob was a big deal for me. Just the help with contest logging will be awesome.

Here's my question . . . beyond rig control, can I also use this interface for digital modes, keyboard CW, etc, or will that require a separate sound card interface? I note that my rig has an FSK-441 setting . . . does that mean I can drive it via this interface?

Insight from those of you who have already paved the way is greatly appreciated.

73 and Good DX

Trent

Hi all, I have just gained a TS450S, has a few problems, firstly no rx audio, secondly nothing when you key the mike. So far I have checked the VCO setting all within specs.Very nice looking radio and I would like to possibly get in back in some sort of working order
Anyone had a similar problem?
Cheers

Tour post was a little short on information.

Have you checked the PTT on the mic?

Does the rig TX full power on CW?

Regards,
Ed

10177. TS-850 cooling fan doesn't work unless it gets a manual spin

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-01-30 18:30:25 UTC
From: JamesL
Topic: 10177 Message: 10177

Hi all. I have a 1991 TS-850 that works great except for the cooling fan. When I key up the fan just makes a high pitch whir and doesn't turn unless helped with a push. I hooked the fan up to a separate 12V source and it turned fine. I also tried the modification to increase fan speed by jumpering R601 but didn't notice any change. Any thoughts on how to fix it?

Thanks,
Jim

Start with a service manual in hand. Go to the RF Board and check for the common 8v line at the TP, then beside it the RXB and TXB (when in tx).

are you sure the internal fan is a 12 v??? and not 8 volt. also, the current available to give the fan a "push" is maybe not enough , but an external supply would...

what voltage do you have at the fan when it is supposed to be running (during transmit)

Hi Ed, nothing as far as output at all, via microphone of send switch on front panel or CW. Audio I dont think could be much maybe a transisitor or something like that. Transmit is zero nothing even registers on RF prode when testing. I am not real sure on the story I got told, i think they were having a lend of me.But I will keep soldering on thats for sure. Martin

Thanks for the reply. I checked the label on the fan and its 12V and it is getting 13V from the radio. I suspect the fan must just getting old. The external power supply is a little more than 13V so maybe its got enough push to get it started. I'll try a 3" fan from Radio Shack.

10191. LP-Pan TS-850s IF response

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-02-02 16:38:18 UTC
From: Jordan
Topic: 10191 Message: 10191

Hi group....

I have finally gotten around to checking out LP-Pan connected to my 850S....It works very well and is very sensitive.

The only real issue is that the passband is distorted close to the IF center frequency...It has dips and rises that are due to the IF coupling into the 850 IF chain and the filter network responses which appear to 'pull' the output down.

On a quiet band, this is almost a non-issue, but below 14Mhz I've seen 5-15dB dips which is an issue if you want to read the panadapter display. High noise levels make it much worse.

Was this an issue with the SM-230...? Would a buffer/amp help..?

I don't know if all the Kenwoods have this anomoly, but given the method of IF output implementation, I'd think they'd all have some degree of the problem...

Any ideas out there..?

Thank for your time...73...Jordan VE6ZT

From: Alan Riley
Topic: 10177 Message: 10192

The TS-850 fan normally only receives about 8.5V in order to have it
run quieter. After replacing the fan, you may want to remove the jumper
you installed that raised the voltage.

A small amount of sewing machine oil or gun oil applied to the bearing of
the original fan may save you a trip to Radio Shack. Don't use WD-40 -
you want a non-gumming lubricant.

73,
Alan, KD5R

Thanks for the reply. I checked the label on the fan and its 12V and it is
getting 13V from the radio. I suspect the fan must just getting old. The
external power supply is a little more than 13V so maybe its got enough push
to get it started. I'll try a 3" fan from Radio Shack.

10193. Re: LP-Pan TS-850s IF response

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-02-02 20:47:22 UTC
From: PaulC
Topic: 10191 Message: 10193

I used my TS-850-SAT with a SM-220, and a BS-8 installed.

I found that a given signal showed taller when it was tuned on the left side of the center frequency, than when it was tuned to the right side of the center frequency.

It was a weird effect... when I tuned up the band, all the signals came in from the right side, and then seemed to pop up after they passed the center frequency. It was not bad enough to be a problem, just an odd visual - as I recall, it was down about 10db difference, smaller on the right.

Hello Jordan, I have mentioned similar problems on TS-870 with the IF output (see my post some time ago), the dips are there too, but only about 15kHz BW around the 8.83MHz carrier, as far as the BW is up to 1MHz, it is a very small problematic part, although on a bad place. As far as the SDR radios have zero beat problem, a nice idea is to shift the LO of the SDR about 10KHz away to be able to have display frequency on 10kHz of the sdr.
This works for me and it is easy to decode the DRM too with Dream.
I can scan the measured conversion loss curve of the TS-870s, i suppose it is similar to ts 850.
Regards,
OK1VAW, Vojtech.

10198. Re: Slope tuning problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-02-04 15:38:28 UTC
From: villy.madsen
Topic: 9951 Message: 10198

Hi Zack

not sure if you are still interested but - here's what I think is going on.. - at least in my TS850SAT.

When CW mode is selected, and if filters in the 270 or 500hz positions are selected, the impact of the slope tuning knob for the mixer associated with that filter is reduced. In Other Words when you select filters in the 2.7 khz position, you can move the passband say 2.7 khz. When you select filters in the 500 hz position, you can only move the slope say 500 hz. It doesn't matter what filters are in those positions - the transceiver has no way of knowing - it's just selecting those positions - and it appears, this only happens if the mode selected is CW.

In my case, I have 2.1 khz inrads in the 500hz positions - tuning the slope trims the bw down a little - maybe to ~1.5 khz when in the CW position. When I'm in the FSK (& LSB & USB) positions, it can easily trim it to a bandwidth of ~ 200hz.

I can see the need for better "resolution" of the slope controls when dealing with filters of 270 and/or 500 bw. It would have been nice if there was a setup option that would allow one to over-ride that..

In the event, it appears that the only really solution is to actually replace the installed 2.7 khz filters with the 2.1 khz ones, or to buy a cw filter to fill the last 8.83 mhz filter slot, or to really bite the bullet and buy a pair - and pull the 2.1 khz and replace them with the cw filters as necessary...

none of these options are particularly satisfying <G>

I would add it to both IF's and I would use the 2.1 the 1.8 pinches the audio too much for for comfort on the ears.I know I tried it and I now have the 2.1 in both IF's if you need to narrow it more use the slope tune. When the filters are added to both IF's it allows for better rejection of in close signals.

From: villy.madsen
Topic: 6646 Message: 10200

I am using a pair of InRad 2.1 khz filters. They are great for contesting and if band condx are ugly - but I still find myself switching back to the 2.7 khz filters for general rag chew. The 2.1s in tandem are just a little harsh for general stuff - I would hate to think what the 1.8s are like.

I am not sure that the roofing filter would be high on my list of things to buy. I do have a have another ham a couple of km away from me - but even with him running a kw 20 or 30 khz away, I don't have much of a problem. However I also have a tendency to run with the AIP engaged, and will also hit the 6 and/or 12 db pads and ride the RF gain control more so than the volume control.

All of which has an amazing impact on adjacent channel splatter. Of course if I lived in K6 land vice VE6 land, I might have to take an alternative approach...

Always start with filters closest to the antenna. It removes garbage the rest of the IF chain doesn't have to contend with.

YMMV

Both Roland and Cliff are correct.

The 2.1 KHz filter is the optimum choice -- your ears won't suffer that way, yet the close-in rejection is markedly improved over the wider (stock) SSB filters. If you can afford it, install matching pairs of 2.1 KHz filters in BOTH IF sections. That way, the VBT circuit "comes alive" and works singly with both IF's having the same filtering. You'll like the results, especially with both filters installed.

Today, I have a pair of 2.8 KHz filters in my TS-850S. The VBT circuit works wonderfully with them in both IF's. When the bands heat up again, I'm thinking of switching to a pair of 2.1 KHz filters -- to optimize the rejection.

I'm still torn over the cost of doing so, so I may just keep the 850 as-is, and order a TS-590S at some point -- if the bands pick up. ;)

Hi all I am progressing a little further each time i get to look at the radio, have now sorted the no audio problem electro caps were unserviceable.Now to get it to transmit... Must say very easy to work on

What Inrad filters do you guys suggest I install in my Kenwood 850ATS? It only has the stock filters in it. I use it for SSB ragchewing mostly but do like to listen in on CW.

I have already had a new CAR board installed and it has the DC-DC board and Noise Blanker mod done by Clif.

73,
Bill

Topic: 10206 Message: 10207

For ragchewing I would not use an optional filter. The tighter filter will make your friends' voices sound unnatural. I would use only the slope tune. If you "absolutely" have to have a filter I would use the 2.1 kHz in the 8.83 slot. For CW I would use the 500 Hz in the 455 slot. 73

Date: 2011-02-16 05:23:00 UTC
From: Tom Osborne
Topic: 10208 Message: 10208

Hi
I'm working trying to get my 2nd TS-450SAT working better. On the IF board there is a socket labeled IC8.

What is supposed to go in there? On one of my '450's there is a black part plugged into it and on my other one, there is nothing plugged in.

I think in the service manual it is probably part number uPC1037HA. If that is the part, are they still available. The radio seems to work without it.
73 and thanks

last week i sold one of my bought new by me. ts850sat's with 1.8, 500 ,and 250 filters.. that leaves me with an 850sat, 870s, ts950sd and ts790s on the op desk. i do not think i am going to unbox the other ts950sd as i have ran out of room with 4 rigs and 4 amps.
i have a boxed ts950sd with both 500 1.8 and 250 filters. i bought it for my mom WA4RTJ sk. she used it maybe a dozen times. Kenwood contacted me about a bias update they needed to make on both of my 950sd's so they were sent back to the factory and all the updates were installed. mom became an SK before i got it back and i just never opened it.
i need to make a list of what i have as i think i may have some NIB DR units for the 850 and 950's also some filters. where would be a good place to find out the fair market value for this rig.?

In my service manual IC-8 is an AN612. It is not socketed but soldered to the board. If missing there would be no SSB Tx audio as that is the Balanced Modulator. I see that IC1 is a PC1037HA which is used as the Product Detector for SSB Rx.

Hi Cliff

Yes, you're right. It is a AN612. I was just looking at the picture on the parts list. But, it is a plug in to socket IC8.

Someone had added a bunch of stuff where that AN612 plugs in. It had a board with the AN612 and another dual inline IC (I can't make out the number as it's worn off) and a transistor. That had a 2-wire cable that went to another board over by the filters with a bunch of parts on it. That had a 2-wire cable that plugged into CN2 and a wire going to a resistor labeled L1. I've disconnected all that stuff as my other FT-450 does not have that.

There was an AN612 on that board that was plugged into and I unsoldered it, but when I plugged it into the socket, the transmit audio doesn't work, so I'd guess I need a new one of those.

My biggest problem I've been working on is lack of sensitivity. On my good FT-450 a signal can be S-9 and on the other one it is S-3.

Now I need to see if I can get another AN612 somewhere. I see them on line but most have a minimum order of $250 or so. Thanks and 73
Tom W7WHY

In my service manual IC-8 is an AN612. It is not socketed but soldered to the board. If missing there would be no SSB Tx audio as that is the Balanced Modulator. I see that IC1 is a PC1037HA which is used as the Product Detector for SSB Rx.

hello, i have problem with my ts850. it has low power on 1.8mhz and 28mhz. it around 60w and no alc indicator. on other bands 3.5 til 24mhz its working okey with 90-95watts. the receiver is ok.

its s/n 3... and has alld dds changed.

whats the problem ? can any one help me ? is it normal that alc is dropping down while i increase power ?

iam new one to 850s.

Hi Tony,

It's a tough call. As far as I know, there's no such thing as a "Blue Book" for used ham rigs. Fair value will depend on condition, options, desirability, and other factors. I suggest you look at the recent listings on QRZ, Eham, and QTH, as well as eBay.

For eBay, you can look at current listings without signing in but that won't tell you what a rig actually sold for. The trick is to sign in and do a search for the item and select the "Completed Auctions" option. What I can tell you is, all of those rigs are still highly regarded and desirable.

10220. TS-450S Menu Option 19

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-02-18 06:06:57 UTC
From: k7zs
Topic: 10220 Message: 10220

My never ending TS-450S project continues. It goes for a week working fine, then it goes back to not going into transmit. Moody little sucker.

I have discovered an anomaly in troubleshooting this. When I try to toggle the menu option #19 (transmit inhibit) from OFF (default, transmit OK) to ON (to make the radio incapable of going into transmit), the receiver audio mutes. If I press CLR still no audio. Power cycle the radio, the radio stays muted. If I again go into the menu mode, and turn option 19 from ON back to OFF, the receive audio returns.

The radio is currently in it's 'no transmit' funk, I have not tried this when the radio is functioning normally.

Is there a correlation? I have performed processor reset etc. No change in this behavior.

Any clues out there?

10221. TS 850 Won't seperate USB-LSB on RX

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-02-22 15:41:55 UTC
From: fyrmandan56
Topic: 10221 Message: 10221

Hello group....I'm a newbie here...Thanx for allowing me to join!
My TS 850SAT, was working fine until recently when I noticed that I am recieving the same stations equally well on both USB and LSB. No amount of tuning/filtering/etc, will allow me to confirm whether the station is on LSB or USB.The ONLY time that I can determine if a stion is U or L is if that signal is very VERY weak.
My TX is fine and does not appear to have the same issue (confirmed by other stations)so it appears to be an issue on the RX side.
I have posted this on the other "repair" group and did get a reply from Jose....but was hoping to catch a few more readers on this forum.Also found that at least one other operator (Don) is having the same issue with RX on his 850.
Any help/advice would sure be great.....Thanx.....Dan

10222. TS-690S

Yahoo group: TS-850_450_690 (2010 — 2016)

From: Ausbin
Topic: 5989 Message: 10222

I lost all of my audio output from the rig today. It shows on the meter that it is receiving plus it will transmit. The audio went out when I was calling a station. All I hear from any of the audio outputs is a click when I release the push to talk button. Have reveiwed all setting and can not find anything wrong with them. The only thing I've done to the rig is to install another SSB filter. Any ideas.

10223. Re: TS-690S - No Audio- Update

Add: Notice when I turn the power supply (Kenwood PS-30) off and the voltage decays my audio came back on for around a second until the voltage drop below a certain level. I replace the power supply with another unit and the rig is back working. Will now check to see what is wrong with the power supply.

Hi all
I did a list for capacitor rework.
http://www.conrad.at/ce/de/ShoppingList.html?view&id=02375abd4db49590ba4674593e34f57e
Its in German but I think its including all capacitors including CAR pcb.
what do you think about?
tnx 73 Joe

Hi

Your squelch did get turned up, did it? 73
Tom W7WHY

I lost all of my audio output from the rig today. It shows on the meter that it is receiving plus it will transmit. The audio went out when I was calling a station. All I hear from any of the audio outputs is a click when I release the push to talk button. Have reveiwed all setting and can not find anything wrong with them. The only thing I've done to the rig is to install another SSB filter. Any ideas.

Dan

I dont know how far the 850 is simular to the 450, but i had the same issue with my TS-450sat.

I my case the 6 K filter was shorted out, i could hear (like you) the stations with the same clarity and strenght switching from USB to LSB, plus strong stations were very wide...

The filter is absolete at Kenwood, so i ended up just removing it. I only have the 12 K and 2.4 K left now, but the RX works FB again...

Scott, I think you guys are all on to something within the filters! You know, I DID just install a new battery on this thing. Did it / could it, have reset to a default.....or something?
By "secret menu" is this the same as the "hidden menu" that I've read about?
OK now, what is the proper filter settings once I check out this menu?
You guys are awesome! I have had 3 responses to my crisis (hi hi) and ALL have pointed back to the filters!

Why am I starting to feel that good 'ol "newbie blush"?

Yes, the hidden menu is what I am talking about. Turning the filter exchange on gives you better TX audio and on my rig makes the ssb do the same thing as you are talking about. When I turn it off, then you can tell the diff between usb and lsb.

I just picked up a beautiful TS-850 with a high 60 million serial number. I remember that the early rigs had some problems with several chips and some of the small electrolytic caps and a few other problems. With my rig being at the end of the production run ,did some of these problems disappear ,in the latter 850's? or show up thru the entire production?
thanks

Dan

Not a problem, i'll see where i can help you with your questions.

I am however a Yaesu guy, the TS-450Sat is the only Kenwood i ever owned and came to me as a part of an estate where i wanted the complete FT-102 line from but had to be bought as a complete lot....
BTW, the TS-450 came allso as a complete line including the DSP-100 and even the mobile bracket!!

From: phil_stanley
Topic: 10237 Message: 10237

Hello - Using TS-450S on PSK31 and getting only 10-15 W before I start to overdrive - using scope to monitor RF. Shouldn't I be able to get more power without overdriving? Any comments/advice would be appreciated!

SET-UP:
TS-450S; MIC = 8 o'clock, PWR= FULL CW, PROC = OFF, NO ALC when xmiting.
SIGNALINK: TX = 10 o'clock, MASTER Volume = 90%, WAVE = 40%
S/W: HRD & DM780 v5.0

Is there a programmable MIC setting in TS-450S that I need to change??

hmmmmm ?

10241. Re: which serial numbers are affected by leaking caps?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-02-27 17:36:55 UTC
From: Alex
Topic: 10239 Message: 10241

Hi,

As for my experience, i rework or re-capacitor 2 TS850. I change almost 95% of electrolytic capacitors inside, the serial is a 60mil type, but i still found leaking capacitors even the later or last serial numbers.

Common leaks are on the board you have said, like CAR, Display, RX board or audio sectio area also the back up battery has a sign of leach. So if the radio is for keeps better re cap it will last another 10 yrs.

10242. Display Issue

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-02-28 01:58:32 UTC
From: Crownhaven
Topic: 10242 Message: 10242

I asked about this once before and no one had experienced this issue. I am noticing, on both of my 850s, that the edges of the little rectangles that display the frequency settings are not sharp. Basically, it looks like the light on the bottom line is going out and instead of a straight line across the bottom of the box, it is sort of scalloped, the scallop being black vs. the light. I only see this on this portion of the display.

Anyone else????????

Steve, N4JQQ

Why not order one from DEM? They're only $25.

Hi Dale,

Well gee, I wouldn't think they would be that popular an item. I might be wrong.

I bought one from Steve at Central States VHF Conference a couple years ago and have been using it with my 850. There are a couple things I might have done differently in the TIB-850 design but it does work great.

10247. DRU-2 Board Brass Screws Wanted

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-02-28 16:27:54 UTC
From: k4zot
Topic: 10247 Message: 10247

Can someone provide two of the small brass screws used to hold down the DRU-2 board under the TS-850 top door. I bought a DRU-2 with no screws. I will send you a SASE and $2.00 for the two screws. By the way, if anyone sees a DRU-2 for sale for a reasonable price grab it. These boards are really neat. I really enjoy just pushing a button to tranmit my call message during a DX pile-up. It works great.

You can get brass screws at Home Depot, or any decent hardware store.

Steve
I down loaded the sheet on the tbI-850 from Demi, but they have no manual for download fron the sitr ,that I could find. Do you also have the write up for the board,as Iam not 100% understanding the setup. If your board is for sale ,what would the cost be?
thanks

10251. Lazy Dog LD-1B

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-03-01 02:26:43 UTC
From: dsh_0403
Topic: 10251 Message: 10251

I have a Kenwood 850 that I have enjoyed for many years, but I have always wished that it had a panadapter type display. Recently after looking around a bit it appears that a better solution than purchasing a pandapter, at least for me, would be to add a few more chips to the pot and purchase the Lazy Dog LD-1B SDR receiver. I think it would not only give me the same capability of a straight add-on panadapter, but also throw in a second receiver as well. That would seem to be a real plus as I do as much HF listening between the bands as I do in QSO within the bands. The one question I have is how the LD-1B compares to the TS-850's receiver. Does anyone in this group have experience with both receivers and care to venture their opinion? Is one particularly better than the other or would I even notice much of a difference? The specs might give a hint but an actual listening experience using the same antenna on both might tell me more.

I have the completed box that was made by DEMI. What the box does is allow you to use the 850 with a transverter switching easily between the rig and the transverter. As you might have discovered, if you make the internal connections for the transverter on the 850, you cannot use it on HF. The box or board takes care of that. You just flip one switch and it goes from HF to the transverter. What model of transverter do you have? How much drive does it require? I never really figured out how to set the drive in the transverter mode. Once Steve started making transverters with common IFs, I went that route. Much easier.

I wouldn't sell this box for less than $100.00. That is about what is cost new and they don't make them anymore. I would probably rather not sell it but I might. I just haven't thought much about it. They are nice to have if you have a transverter with a low power input and split transmit/receive. I guess he stopped making them due to the common IF option he came up with.

Subject: Re: [TS-850_450_690] wanted a DEM TIB-850

I have the completed box that was made by DEMI. What the box does is allow you to use the 850 with a transverter switching easily between the rig and the transverter. As you might have discovered, if you make the internal connections for the transverter on the 850, you cannot use it on HF. The box or board takes care of that. You just flip one switch and it goes from HF to the transverter. What model of transverter do you have? How much drive does it require? I never really figured out how to set the drive in the transverter mode. Once Steve started making transverters with common IFs, I went that route. Much easier.

I wouldn't sell this box for less than $100.00. That is about what is cost new and they don't make them anymore. I would probably rather not sell it but I might. I just haven't thought much about it. They are nice to have if you have a transverter with a low power input and split transmit/receive. I guess he stopped making them due to the common IF option he came up with.

I just purchased a TS-450 at a local yard sale and have a YK-88CN filter from a TS-440 sitting on a shelf.

Can I use the YK-88CN in the TS-450?

Thanks

Gary KN4RY

If you buy the little mounting board from Inrad you can. Its the same
filer mounted on a PC Board in the 450 and most all the newer Kenwoods

NO, it cannot be used. The YK88CN has a different center frequency than the YK88CN-1.

Has anyone ever just stuck in the filter with double-sided tape and
wired the pins?

Looks like the signal pin is 2nd from the inside on either end, with
grounds on either side.

Also, I've seen Inrad boards with "flying leads" instead of connectors
-- are these factory?

Order the usb to serial adapter, and you can continue to use the cable you had, change cable to a 9 pin

I use the pl 2303 type no problem. And also the edgeport, multi port device, but they are all 9 pin..

Are you sure your new computer will not have 9 pin serial connection...

Are you using the kenwood if232c?? Then you will need 25 to 9 pin adapter in there somewhere, or cable wired as that..

Dave

Hi Rich

You can use an USB to serial converter for rig control.

Most of them are set up for 9-pin cables, though. I have an Edgeport that I bought on eBay for about $25 and it works for radio control just fine. I have a serial CAT cable that I bought from G4ZLP and it works great with the Edgeport (and it actually gives me 4 serial ports for other stuff). 73

The AIP and ATT should both make a difference. The transistor I referred to on the 850 is switched on in TX to protect the front end of the rx. The 450 has the same circuit but if the AIP doesn't make a difference it's probably something in the AIP circuit.

Mike,

Piexx makes aftermarket version of tone boards for a lot of popular rigs
from Kenwood, Icom, and Yaesu.
I think what you are looking for is the Kenwood TU-8 since that is what I
have in my TS-450S. The Piexx version is expensive but it can be found here;
http://www.piexx.com/index.php?main_page=product_info&cPath=6&products_id=16

Good luck

Yes Bob it is for working 10 meter repeters that require a tone.
Since 10 is opening well makes since.

Good Evening All,

I have a TS-450 with intermittent TX audio on SSB. I wanted to find out if the 450 suffers from the same capacitor issues the 850 has? Or if there is a common failure component in the audio path on the 450. I would appreciate any and all advice.

make sure the attenuators aren't on, does it have the aip as the 850???

How to fix it, depends on why it isn't working

Could be solder joint, bad meter movement (does it work on transmit ok??)
could be weak signals, could be agc set to off

Diagnosis, I guess is where to start..

Hi Dave,
It is not the mike. I will just trace it out. I thought there might be a common failure component.
Thanks for the reply all the same.

You might just have a loose grounding screw somewhere. Slightly loosen
and then retighten the screws that ground the amp and especially the
filter circuit boards and see if that solves it.

Do the same as below, BUT do not put the covers back on... if it is OK, then maybe the cabinet is pinching somewhere, or keeping heat in too much and causeing overheat shutdown, in the finals

Try running an extra fan on the unit, see if it helps

Sometimes if you can find these parts at a different source it can be a lot cheaper.

I recently purchased a balanced mixer chip from Kenwood East. Part cost about $10. Shipping cost was $9.00. Actual shipping cost was $0.88. 73
Tom W7WHY

Once again...Thank you very much Clif
I will try this substitute. Didn't get this one the first search

Things were a little crowded on the bands over the weekend, 20 was almost impossible and 15 was still not much better. I am thinking about adding a SSB filter to my TS-450. I have read about some people not happy with the YK-88SN-1. What about Inrad ? What are some of your favorite SSB set ups for the 450 in crowded band conditions??

Rich , KDØZZ , ☺

These are the humble ramblings of an old phart and in no way should they influence the actions of any intelligent and sane person

The INRAD filters have always been better. I'd go for the INRAD 2.1 KHz @ 8.83 MHz -- good performance while providing decent SSB sound.

Hi Rich,
I believe the INRAD 2100 Hz filter is as good as you can do.
The 1800 Hz Kenwood filter reduces the audio quality too much.

Just got a TS-450SAT. Works great but some display segments on some frequency digits are on all the time. Not a problem on all digits. I assume problem root cause would be on the LCD Assy. Just wanted to get 2nd opinion before I order a replacement LCD assy.

Good luck finding one. The price is about $200 new. I saw one on Ebay yesterday for a starting bid of $50; better jump on it. Good luck.

I am going to part with a TS850SAT that my mother bequeathed to me while I was living in JA. Full output on all bands as appropriate. CW filter. Battery replaced a few years back. Sidetone>MON mod performed and documented. 850$OBO shipped. Or, if you want an Astron PS included, you pay shipping. Will accept as partial trade for IC7000. Cosmetically 9.5/10. Mic, original boxes, manual, service manual, external control manual, power cable included. Will ship internationally, but let's make arrangements.

Photos: http://www.flickr.com/photos/jonathancharles/sets/72157626376699670/

Drop me a line off-list for my phone info and if you have further questions. Ships from St. Paul, MN.

Hi Tom
Thanks for your input on this matter. I got some components from Kenwoodparts when I was in need of some varicaps for my TS440 a few months ago. Unfortunately is quite hard to get substitutes from other sources like Mouser, Allied, DigiKey and some others. Unfortunately they don't carry much of this stuff. Kenwoodparts knows this so they make the gain :)

Actually the diode is not the only problem on the HF unit. I don't have RF getting into the board so now I am trying to trace back the problem to the RF unit. Quite hard because the transistors are on the other side of the board to take some measurements :(
For now I need to continue with the troubleshooting process before asking further questions
Have a good day :)

Wake up, blame the US parts houses. Kenwood uses a common, to them, part. They sell replacements thru the distributors who sell at the price they are told to. If the US parts house carried the part it might be cheaper, might not. Many times Kenwood is cheaper.

On the shipping. I hate paying high shipping costs as much as anyone but that 88 cents was postage. The part walked off the shelf and jumped into a free box, with free packing material, and taped itself up with free tape, printed the free label, and set itself out for the postman to pick up. Uh-huh. Some places just charge more for all those freebies.

10310. TS-450 SSB power drops off after warm-up

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-04-04 13:14:29 UTC
From: Bob
Topic: 10310 Message: 10310

I wonder if anyone has experienced this problem? When rig is cold SSB power out is fine and ALC meter reads properly with mic gain at about 10 oclock. After few minutes of rig being on (not necessarily transmitting) there is not enough transmit audio to even create any ALC with mic gain at full and PEP power drops to less than 30 watts using a true peak reading meter. Audio level coming from IC15 into IC8 (balanced Modulator) looks good.
Thanks,
Bob - W4BBN

Clif,
It does the same on all bands. CW, FSK and FM carrier power is not affected. Just SSB, acts almost like you cut the mike input level by 10dB or more. Different kenwood mikes provide same results. Once the rig gets stone cold it will start out with full power ssb and then drop off within a couple of minutes. It may be in the ALC circuit.

A quick glance at the SM shows the ALC is applied equally to SSB and CW. Were it the problem it would affect both equally.

My money says C104 has leaked and causing problems with the 455 IF filters. This is prior to the cw being injected and would not affect CW operation. Most likely the filters will have to be removed and the board cleaned as well as repairing damaged traces and thru holes.

10320. TS950SDX

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-04-05 00:59:07 UTC
From: Alex
Topic: 10320 Message: 10320

Hi to all,
This is off the group model but i need help for this radio. Hope someone can give advice and help.

I have in my table a fellow ham 9TS50SDX, the radio shows problem, when first power ON the meter display full scale and can not receive signal after a few seconds the meter will flicker up and down and the receive will also on and off on strong signal. After the receive comes in, i will try to TX but after PTT release the meter becomes full scale again flicker and flactuates and i will wait until it will rx again. After maybe 15mins when the radio warms up all will become normal.

Is this AGC problem same as the 450 or 690? or something to do with the TX/RX switching. I bit confused where to look in with. Can someone help especially clif.

Thank you,
Alex

10321. RF Unit or repair

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-04-05 01:39:25 UTC
From: Michael Champion
Topic: 10321 Message: 10321

I have a TS-850. I need to replace L65 in the IF out circuit.

I have an LP-PAN connected to the IF out port. The (-) lead for the LP-PAN was loose and when I pulled the power supply out to remedy the problem it touched the + side of the supply. Unfortunately this burnt a trace in the LP-PAN and also popped the secondary(or primary) in L65. I am fairly certain of this since the only resistance I can measure is the resistor (56 ohms) that is in series with that winding.

Is there a source for that part? Or does someone have an RF board they want to sell?

The service manual has L65 listed as part # L34-0781-05

Thanks,

-Michael

I'm not an expert and I am sure someone here is but it sounds like the AGC is hanging on. Now how to fix it is beyond me.

Hi John
Have you found the problem with your 450?
After solved a couple of problems on my rig (HF unit inductor, driver transistor and resistor), I found out that the transmitter doesn't work on 12 and 10 meters. Altough receives perfect there is something wrong perhaps on the pll or car units.
If you or anybody else has experienced this issue before , I am open to any suggestions
Thanks a lot and have a nice day

Define doesn't work?

Does the display go to dots?
Does it go into TX mode?
What is the current draw in CW mode with power and carrier up?

Hi Clif
I am sorry I was not specific enough on my explanation.
RF is not coming out at the antenna output on that frequency range.
The display shows up the correct frequency (no dots)
The "ON AIR" led lits up
Couldn't measure current because I am using a PS-50 power supply.

I got another message from Manfred DF2PD who suggested the relays on the filter unit.
Well.... I just checked them and found K7 and K14 are both dead (the coil indicates good but the contacts apparently are bad)
So I will order the parts and wait until they arrive.

Thank you very much again for your quick and VERY helpful responses ;)
Have a nice day

Hello, all the list!
Good morning! I look fot the help of someone for info about my TS850S and it's 455 kHZ/250 Hz CW filter.
It come from INRAD, and up to now, I did not had any problems with any filter instalation.
Well I recently ordered two CW filters with INRAD, 250 Hz species(!).
The 8.830 one was instaled without any problem. That 455 kHz one did not work!!!
When I select it, whatever position for the 8.830 filter selector, no signal come through the 455 one.
The activation button on top of the TRx are OK, and I did not found any diodes problem.
So can anybody help me by giving me some idea about what I can do? I have the maintenance book for the beast!
Thank you in advance for any help!

I just joined the list and thought I would introduce myself.

I've been a ham since 1954, (FA8AY, then VE2AFD in 1960, and now F5UL since 1964) and have used a lot of different material since then (Johnson Viking Valiant Tx, Heathkit HW32 then HW101, SP-400 Rx, Colins KWM-2, Yaesu FT-200,Drake TR7, then Elecraft K2 (that is my contest machine, QRP for sure!)

My TS-850 is now my main rig, since two years (end 2008). I really like the 850, and I don't plan on getting rid of it for long time.

I think it has one of the best receivers around.

I currently operate mostly CW or PSK31 and some RTTY and Hellschreiber.

I'm retired now, age 77.
We (YL and myself) sold our house on the French Riviera, and now we live in a small city (SEYNOD), near ANNECY, 40 km south of Geneva.

And we like it!!!

73,
Robert, F5UL

Well after sorting out the audio problem,bigger troubles have surfaced, I got the dreaded dots on the display.. If i remove cn6 from the carrier unit i get full read out, i realise the dots are vco not locking, after hooking to tp 2 on the PLL board i get full 8 volt reading, with no voltage adjustment on L5 7 or 9... havent had much time to get right into it due to work commitments, does anyone have any suggestions
cheers

Hello group. I've been pickin away at a number of issues on my TS850. Seems I fix one problem and another surfaces.
Just replaced D49 and did the D31 mod and it sure did pick up my hearing! However now, I am showing some carrier while TX on SSB.
Did a quick search on previous posts but didn't find an answer.
Anyone have a suggestion?
Thanx.....Dan

10336. 850 memory scan, not stopping on sigs

Helpful Hams,
Good morning from "sunny" Southern California. New to the group (thanks to all the admins that helped sort through my abundance of non-family-friendly email addresses) and thought I'd say hi.

I am a relatively new General (had my upgrade since 10/2009, but only recently picked up my first TS-130s), so still have a bunch to learn about what does what on even the most basic of radios.

I had a deal cross my path recently that I couldn't pass up, and picked up a TS-850s with an MC-80. I've only been able to tool around with it for a couple of days, sifting through the manual along the way, and I know it has the DRU-2 board as it records things I say when I tell it to, but hoping someone can tell me what other extras might be in there.

I've posted an album with my call (KJ6BGS) with pics of the top where the DRU-2 (and other stuff?) should be, and then the bottom where I think all the filters live...not that I'm certain since I'm still learning what filters do. There's also a pic of the back.

On to the first round of questions:

* I think the IF-10 is already installed, the connector for ACC-1 looks like the right interface, no?

* On the DRU-2...should it retain the recording after the radio (and power supply) powers down? My thought is that it should, and since mine isn't, there's probably an internal battery that needs looking after...but figured I'd make sure before I go digging around.

So far, it receives wonderfully, but the bells and whistles make signals "sound" different than my simpler TS-130...so I need to work my way through all that. No idea how well it transmits but the on-board tuner makes for fantastic SWR on my 20M dipole that I made from bits of wire.

Thanks for your help,
Ed
KJ6BGS

Topic: 10337 Message: 10339

On to the first round of questions:

* I think the IF-10 is already installed, the connector for ACC-1 looks like the right interface, no?

*****if10 not required as an option. Plug in 6 pin din from if232c or equivelent

* On the DRU-2...should it retain the recording after the radio (and power supply) powers down? My thought is that it should, and since mine isn't, there's probably an internal battery that needs looking after...but figured I'd make sure before I go digging around.

*** there is a battery (not the radio backup) on the dru unit, it may be dead...

Hello Ed,
I tried to respond to this post via my fancy cell phone, but messed up somehow......hope this isn't a duplicate....

I can only offer help on the DRU-2:
Yes, there is a battery on the board and if it is dead, I'm pretty sure you will lose the recording on power down.
The DRU is located under the little top hatch.....but I think it is easier to access it by removing the entire top /cabinet cover. (carefull of the speaker wire)
You will see the DRU as it has a large button type battery that is easily visible.
Once you have the board out, you will need to unsolder the battery. My tip is to install a batter holder that allows for EASY , future battery exchanges. I bought mine at Radio Shack. It will install with only a very small "tweeking" . The battery that will fit in the new holder is a little smaller and with less maH but in my opinion, worth using as battery changes will take about 10 seconds after the mod! PLUS, the replacements are waaaaay easier to get and cheaper than the Kenwood part.
Sorry ED, I'm away from home and I don't have the RS part # in front me but when I get home, I'll be glad to post them if you're interested.

I'm not even going to consider myself an expert but this is just one mod I did that seems to have worked out fine and was VERY easy to do. Please, if anyone has input that corrects anything I said ....PLEASE DO SO !!!!!!

Hope this helps........Dan

Subject: [TS-850_450_690] Hello, and questions.

elpful Hams,
ood morning from "sunny" Southern California. New to the group (thanks
o all the admins that helped sort through my abundance of
on-family-friendly email addresses) and thought I'd say hi.
I am a relatively new General (had my upgrade since 10/2009, but only
ecently picked up my first TS-130s), so still have a bunch to learn
bout what does what on even the most basic of radios.
I had a deal cross my path recently that I couldn't pass up, and picked
p a TS-850s with an MC-80. I've only been able to tool around with it
or a couple of days, sifting through the manual along the way, and I
now it has the DRU-2 board as it records things I say when I tell it
o, but hoping someone can tell me what other extras might be in there.
I've posted an album with my call (KJ6BGS) with pics of the top where
he DRU-2 (and other stuff?) should be, and then the bottom where I
hink all the filters live...not that I'm certain since I'm still

earning what filters do. There's also a pic of the back.
On to the first round of questions:
* I think the IF-10 is already installed, the connector for ACC-1
ooks like the right interface, no?
* On the DRU-2...should it retain the recording after the radio (and
ower supply) powers down? My thought is that it should, and since mine
sn't, there's probably an internal battery that needs looking
fter...but figured I'd make sure before I go digging around.
So far, it receives wonderfully, but the bells and whistles make signals
sound" different than my simpler TS-130...so I need to work my way
hrough all that. No idea how well it transmits but the on-board tuner
akes for fantastic SWR on my 20M dipole that I made from bits of wire.
Thanks for your help,
d
J6BGS

10342. OFf Topic TS-950 Question

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-04-20 22:00:03 UTC
From: n6ax
Topic: 10342 Message: 10342

Realizing this is not a TS-950 group, perhaps someone can direct me to some help.
I am working on a 950SDX and it's transmit is very slow to come up (FSK-mode does not reach full output for 6 or 7 seconds, for example).
In addition, maximum power output is about 70 watts....the MRF150s and drivers are fine.

ALC voltage initial setting is within spec.

Output power adjustments do not affect max output.

The problem is on all modes.

Any help is appreciated.

Thanks

John

We used to call that "Working as Designed" -- slope tuning reduces the filter bandwidth significantly as you raise the low frequency cut-off, or lower the high frequency cut-off. The "normal" setting for these two controls (lo cut and hi cut) is at their respective extremes.

Most SSB transmitters have a variable resistor to null out the carrier,
the TS 850 is no different in this respect to any other TX, so its likely just
a simple adjustment, usually a tweak of the ' carrier balance ' pot.

seems to be vr8 and vr9 on the IF unit, most sets i have aligned used just one variable resistor for this purpose, so double check this info as i dont know the 850 well yet.

see service manual ' ADJUSTMENT ' item 32 on page 105 of the pdf here Dan. good luck, i've just picked up my first 850 so i'm new to this particular set.

> Thanx Marrc! I just recieved my service manual today so I'll get on it as soon as I'm done with my Saturday " honey doo" !!!

yes Dan, i'd certainly have a look at it, but as i have only had the 850 a fortnight so far,
i would re-read the alignment detail in the service manual just to check, but there are several guides 'round the net, the first i found when i got the 850 home was K6LL's on N6Rs site

http://n6tr.jzap.com/850repair.html#TS-850_Carrier_Balance_Adjustment

about 3/4 of the way down the page. hope its just this simple adjustment :)
Good luck Dan !

10357. Re: 850 memory scan, not stopping on sigs

Yahoo group: TS-850_450_690 (2010 — 2016)

From: Marrc
Topic: 10336 Message: 10357

I just re-read the manual and nowhere does it actually say
it'll stop on a squelch open whils scanning VFO or memories :(

i guess i'll just resign myself to the fact that the TS 850 SAT doesn't stop
on an active freq or mempry channel whilst scanning.
very odd. i wonder if the 450 and 690's stop on 'busy' channels ?

I need a lay down .

10358. TS450 antena tuner?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-04-24 22:35:08 UTC
From: cardinalekaren
Topic: 10358 Message: 10358

My antena tuner has stop working. with it off my antena reads 1:2 to 1. When I turn on the antena tuner it no longer seems to seek a better SWR. It quickly flashes the display and then the SWR will go to infinity. If I put a dummy load on the rig with nothing else atached the SWR is 1 to 1. If I activate the tuner the SWR will jump up to infinity. I don't here the tuner "working" inside the radio any more?
Help!
Mike N3ROV

Ok after doing some more checking it seems that 20meters is the band it is really not working on. Dummy load on 20 is 1 to 1 but with the tuner is goes sky high. But on some of the other bands it is working ok but still not quit right. Witht the dummy load it is 1 to 1 on all bands but if you hit the auto tune button it will tune but the swr will jump ..in most cases to 1:5 to 1. Hit the button a second time and it will then tune 1 to 1. So it is sorta working but not working for 20m. On 20 it trys to tune but auctualy makes it worse.

I have the CAR control up still no good. The thing is this ts450 will tune everything except 20 meters. It tunes the other bands but it seems to take 2 tries. 1 attempt will be OK but a second time it will bring it down to 1to1. 20 meters doesn't work no matter what. It makes the SWR terrible.

From: Mel Cruts
Topic: 10358 Message: 10362

I have found it good with automatic antenna tuners to first tune them to a reliable dummy load and then switch to the antenna. We do not know what settings the antenna tuner starts from and if it is a very bad start setting, it may take it too long to arrive at a good tune-up, thus a tune-time-out stop. I think I first learned this trick with TS-440 many years ago and have found tuners in general will arrive at a good SWR faster if they start from settings for an ideal load, i.e. a 50 ohm dummy load.

This procedure will not solve all problems but it certainly has helped me to reduce my own personal problems. I was just counting in my mind that I've used this procedure on at least six different radios from four different manufacturers.

Hello, I would suggest you find someone with an Antenna analyzer. Make
sure the problem is/is not with the antenna. I have used a TS-450SAT enough
to believe it when it said something is wrong with an antenna.
Good Luck! Les 73, NQ0J

I would make sure K104 is good. That is the 20m relay in the tuner. For the hard to tune on all bands I would replace C1 in the A/5 board of the tuner.

Clif could you give ne a little more detail? I'm OK on electronics but I'm not a pro. the 20 meters will tune but it doesn't make the swr better it make it very bad. it can take a dummy load and make what was a 1 to 1 go to infinity on SWR. On the other bands it would take a 2.3 to 1 and with 1 push of the button make it 1.5 to 1. then another push might make it 1.2 to 1 then 1 more and it would go to 1 to 1. 54

10366. still no RX audio after C104 replaced

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-04-27 03:48:04 UTC
From: radio_op
Topic: 10366 Message: 10366

Today I replaced C104 on the IF board because my TS-450S had no RX audio. Nothing from the speaker nor headset. The cap looked bad, looked to have started leaking but no damage to board. After C104 was replaced, I tested the radio and still have no RX audio. I am at a loss. Does anyone have any suggestions I can try?

Thank you,
Bob - K2RET

K104 is the relay in the tuner that grounds a turn on thefor 20m. If it doesn't work it won't tune. C31 is a 56pf silver mica cap on the tuner input that if flaky causes erratic tuning.

If the cap leaked onto the board it damaged traces and or thru holes. Look around the area of the cap for bad thru holes. Especially on the cap mounting holes. The audio is routed thru the cap and if it's connections are damaged, no audio.

Check all the thru holes in the area, if they are black they have damage. They should all be copper colored. Look around on other parts of the board for an idea of what they should look like. I have also had the leak damage the connections for the 455 filters located beside the cap.

Thanks Clif, I'll check it out. I have the tuner nearly out of the rig now. Do you think this could have been caused by me doing most of my tuning on 20 meters. I had the rig running thru an external (mfj)tuner and I know I had not switched it to the coax direct more than once and activated the auto tuner in the rig. I also tryed letting the tuner in the rig tune a loop wire that was cut for 80meters.

You're not doing it any favors by repeatedly trying to tune an antenna that it can't handle.

Keep us posted.

I had the rig running thru an external (mfj)tuner and I know I had not switched it to the coax direct more than once and activated the auto tuner in the rig. I also tryed letting the tuner in the rig tune a loop wire that was cut for 80meters.

I figured that it wasn't that good for it. But I guess I hoped the protection circut would keep it safe. Live abd learn. I have the tuner out and can see the relay in question. where is a god place to find a replacment? I also want to change the memory back up batery while I have the rig apart. Any advice for that job?

10372. Re: still no RX audio after C104 replaced

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-04-29 01:21:29 UTC
From: radio_op
Topic: 10366 Message: 10372

Hi Clif,
Well I had a better tech than I look at the radio today. Although I replaced C104 and still had nothing, I may have saved it from the C104 failure before it got worse. What my tech found was the matching PS-53 power supply that I used and gave to him also, had 2 bad pass transistors and a bad driver transistor. The supply was putting out 22VDC. I never thought of checking that. He hooked the rig up to his bench supply and it works perfectly. Guess I learned to always check the obvious....

73' and thanks for the help,
Bob - K2RET

Cross your fingers. The finals do not like over 18v. They generally open up. Everything else should be fine.

10374. Double sidebands on RX

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-05-01 14:56:33 UTC
From: Robin
Topic: 10374 Message: 10374

Hi,
Iâ□□m new to this group, but have a TS850SAT (second hand) for several years. I use it exclusively for Â« Digital Modes Â» with connection via ACC2.
I notice on receive that there are SSB Â« ghosts Â» ; the receiver is picking up signals equally from USB and from LSB regardless of the SSB mode selected.
As far as I can judge, it only transmits one sideband as selected by the USB/LSB push button (no reports of double sideband transmissions from other hams)
I donâ□□t have a Service Manual and the User Manual is not much help in trying to decide if this is a mal-function or a mal-adjustment of the SSB receive circuit.
Iâ□□ve learned to live with this annoyance, but does anybody else know this problem ... and a solution ?
Thanks.
Robin, 9H1ZZ

Robin

Did you notice that the RX pass band is allso very wide?
If so, i had the same issue with my TS-450. Turned out that the 6 KC filter was shorted out... i removed it (new ones no longer availlable), and all is OK now. Ofcourse the 6 KC position does not longer work (no RX) but 2.4 and 12 does, and no more wide RX anymore...
Hope this helps...

If I remember, a jumper needs to be cut when installing a filter on the 850. So when you remove the filter, maybe the jumper needs to be re-added...

Hello Robin,
I too am having the same issue with my 850. I have posted it on here a few months ago and also had replys from a few other operators who are suffering the same annoyance.
At this point, I'm thinking we must have an unusual problem as no one has been able to offer any advice....although one person suggested to adjust the slope controls. This did help my own issue but only in a VERY limited way. I can only get the needed, opposite side band suppression about 10% of the time.....or less. If I change freq. I have to start all over again. I have tried every filter setting, slope, notch and whatever setting possible , to no avail. Please Robin, if you get any private responses on this, will you kindly pass them on to me? FYRMANDAN@aol.com
Thanx to the group......Dan

Subject: [TS-850_450_690] Double sidebands on RX

Hi,
â□□m new to this group, but have a TS850SAT (second hand) for several years. I
se it exclusively for Â« Digital Modes Â» with connection via ACC2.
notice on receive that there are SSB Â« ghosts Â» ; the receiver is picking up
ignals equally from USB and from LSB regardless of the SSB mode selected.
s far as I can judge, it only transmits one sideband as selected by the USB/LSB
ush button (no reports of double sideband transmissions from other hams)
donâ□□t have a Service Manual and the User Manual is not much help in trying
o decide if this is a mal-function or a mal-adjustment of the SSB receive
ircuit.
â□□ve learned to live with this annoyance, but does anybody else know this
roblem ... and a solution ?
hanks.
obin, 9H1ZZ

Thanks for that info Jean-Pierre. You could be right with your diagnosis.
I always want to operate the rig as wideband as possible, so never tried the filters. The digital mode software does all the processing.
I recall when I first got the rig, I played with the filter buttons but they didnt seem to have much effect, so never bothered anymore.
I will check the filters now to see how they behave, before doing something drastic with screwdrivers, wire cutters and soldering iron.

Subject: [TS-850_450_690] Re: Double sidebands on RX

Robin

Did you notice that the RX pass band is allso very wide?

If so, i had the same issue with my TS-450. Turned out that the 6 KC filter was shorted out... i removed it (new ones no longer availlable), and all is OK now. Ofcourse the 6 KC position does not longer work (no RX) but 2.4 and 12 does, and no more wide RX anymore...

Hope this helps...

Topic: 10374 Message: 10384

Issue identified and eliminated. Incompetent operator problem!
Thanks to Clif for his off-line explanation.

In using digital mode signals with AFSK (400-2600 Hz SSB), the receiver IF filters must be selected for 2.7KHz.
Opening up the IF any wider allows the other sideband to be detected as well.

Hope this helps others with similar operating procedure problems

What my tech found was the matching PS-53 power supply that I used and gave to him also, had 2 bad pass transistors and a bad driver transistor. The supply was putting out 22VDC. I never thought of checking that. He hooked the rig up to his bench supply and it works perfectly. Guess I learned to always check the obvious....

Hi Kevin,

The SO-2 is mighty pricey for what it is. There's a temperature-controlled crystal heater made by Kuhne Electronic (http://www.kuhne-electronic.de/en/products/crystal-heater/qh-40-a.html). N3BA has a VCTCXO that fits where the SO-2 fits. Even simpler and the least expensive is use of a PTC thermistor that you attach to the 20MHz reference xtal. Damon/KC5CQW came up with that. Details are in message #9150. Total cost: about USD $2.

They are available from Kenwood. I just bought one for a TS-690SAT and the cost was a little over $12.00. They have a nice site that you just place the part number in and it tells you if the part is available plus the cost of the part. The site is: www.kenwoodparts.com You can order directly from the site and they do have someone that monitors their email because I ask them a question and received a reply back with the answer within 5 minutes. Hope this will help. 73, Ausbin, K5ZRR

Topic: 10395 Message: 10395

1st issue was a good cleaning, tighten the dial shaft nut,and look around inside,

2nd issue, extremely low audio, all 3 outputs, plugged the rear audio out to my stereo in and cranked it to 10 before I could hear anything. Will try the C103? change out and then trace audio back thru the internal amp this weekend, if momma lets me have some me time.

3rd issue, I have two grey coax lines not plugged into anything. One comes from the RF board beneath the IF board, the bend seems to show it may have been routed to where the AT450 plugs into the IF board, the other, with a yellow tape on it seems too short to have gone there and i can't see exactly where it originates from, are these supposed to be plugged in somewhere? Be darned if I can find where.

Previous owner only had 5A ps so I assume it was just used for listening, no mike was with it either. Hope to get this up and going.

Thanks in advance - 73

Change C103 and make sure none of the thru-holes are open.

3rd Issue. HUHHHH. The RF board and the IF board are side by side on the bottom of the radio??? The AT450 does not plug into the IF board, neither coax wire. They both plug into the Filter unit, side by side. Figure out which boards you are talking about and we can go from there...

10397. question re thermistors in PS-53

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-05-06 21:58:10 UTC
From: ve1ii
Topic: 10397 Message: 10397

I hope this isn't too far off topic.
I am repairing a PS-53 power supply that was damaged by a near-by lightning strike.
When I started the output voltage was 23 V. After replacing all of the transistors I now have output voltage of 10 volts. The voltage adjustment pot controls the voltage, but 10.4 is the upper limit.
I have not replaced three zeners, two are 9.1 volt and one is 15 volt.
Also there are two thermistors. I don't know how to test them and can not find data on them. I see lots of thermistors on eBay, but no way to tell what ones might be equivalent to the two in the supply. one in the supply is a 32D27 and the other is a 5TP41L.
If anyone can shed some light on this for me, please send a note direct.
I'm still working on my TS-450S which was also damaged. :-(

73,
Bruce, VE1II

For your information they were out of the surge protector and had to be ordered from Japan. Even with that it only took around three weeks for all of the items to arrive.

They are available from Kenwood. I just bought one for a TS-690SAT and the cost was a little over $12.00. They have a nice site that you just place the part number in and it tells you if the part is available plus the cost of the part. The site is: www.kenwoodparts.com You can order directly from the site and they do have someone that monitors their email because I ask them a question and received a reply back with the answer within 5 minutes. Hope this will help. 73, Ausbin, K5ZRR

10404. TS-850 with oscillating output and more

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-05-19 18:54:46 UTC
From: Rein A
Topic: 10404 Message: 10404

Hello All,

After many years of reliable service, my trusted TS-850 has started to act up.

Most my usage has been with running digital modes with low output
and matched antenna's and loads.

When I adjust the output to 10 W being it in CW or SSB and go to send
50 % of the time the output comes up as it should. In perhaps 10 %
there will be no output and in the rest, the output comes up as if a
capacitor is charging up/down. Output at max. will be stable and then might drop to zero
and the process repeats. (time constant a few seconds, up to 10/15 seconds.

I listened to the output with another receiver and the drive/modulating signal appears to
be present and constant.
So it appears to happen in the final stages.

The time constant of this seems to depend on set output level.

It appears that in the power output control circuitry , something has a bad contact/relay
or perhaps a semiconductor is acting up.

I looked at the circuitry controlling the output stages, and it appears rather complicated.
Perhaps I can get here some suggestions what this could be or better even where to start to
locate the problem.

Looking forward to suggestions,

73 Rein W6SZ

10410. TS-450 Instability Repair-New Finals

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-05-23 14:08:47 UTC
From: infomet2003
Topic: 10410 Message: 10410

I have had an interesting round of troubleshooting and soldering with my TS-450 lately and would like to see if anyone has seen anything similar. Perhaps my experience will help someone.

Background:
I bought my 450 in like new cond. not long aftr they came out. It belonged to a friend of my bro and had seen little use. I've enjoyed it all these years and think it is a really fine piece of gear. I don't use all its features and have felt no urge for a new rig, until I started having trouble a few months ago. I have operated my 450 head to head with a K-3 and, aside from having more flexible filters and less ringing, the K-3 didn't seem to receive any better! It certainly didn't make me want to spend $2K!

I do some building of tube stuff and fix up some boatanchor gear, so operate relatively little, so the 450 does not have a lot of hours on it. I am surrounded by trees and have been too lazy to put up a tower, so I use a random wire that goes from my basement shack up to a flat top about 100 ft long. I match it with a little MFJ tuner, which gets me to 1:1 SWR on all bands.

A year or so ago, I experienced erratic behavior and difficulty matching my antenna. Being shy about tearing into the unfamiliar guts of the 450, I decided to send it off, a very unusual thing for me to do! Anyhow, I somehow found Clif and sent him the rig, which he fixed (bad relay on filter board) and returned promptly. That was a good experience, except for the Fedex charges!

Trouble:
A few weeks after getting the rig back, I started having more erratic behavior. When I'd tune up, on any band above 40m, I'd get to 1:1 just fine, then after transmitting a short time the SWR would rise! Interestingly, the rig always worked fine into a dummy load! Well, I won't go over all the theories about this (bad tuner, bad coax, bad grounds, bad karma, etc.), except to say that none of them were right. Then a local ham (Terry, WA4BVY) heard the story and immediately suggested that deteriorating junctions in the final transistors could cause my symptoms. Now Terry is a veteran of several companies doing several techie things, including commercial radios and cellphones, so his analyses are always relevant.

Repair:
After hemming and hawing for a few months, I finally decided to show soome character and dig into the 450 myself, figuring there wasn't much to lose and in the worst case I'd end up with a new rig if I killed the 450. I've been offered $200 for it as a parts donor.

After considerable searching, I found replacement finals and ordered them, thereby guaranteeing that I'd have to do the work...can't have $70 worth of unused silicon lying around now, can we? I'd never dealt with transistors with the big solder tabs, so it was with great trepidation that I opened up the 450 and went at it with my old Weller gun, the only iron I have capable of heating such big globs of solder! I was careful, of course, and managed to lift the tabs one at a time and not destroy the circuit board, a major milestone for me!

Then I tinned the backs of the tabs on the new finals, bolted them down, and hit them with the Weller. I got solder to flow under the tabs, so figured I had good connections. Then it was just remembering where all the little screws went and hooking the filter board back up, which was no problem.

Results:
You can bet I was apprehensive when I turned the rig back on! It's a minor job, of course, but I am really leery of all that silicon and delicate hardware, being most at home with tube sockets and filament transformers! Anyhow, the RX came to life and I started feeling better. Not being shy, I checked with Clif a couple of times along the way and he responded generously. Most importantly, he advised careful setting of the bias on the finals, to get proper idlinig current. I knew to do this from the service manual, but the manual procedure is incomplete and garbled, so Clif's directions were crucial! The actual setting was trivial and only took a minute, if that. Double checking and worrying took quite a bit longer!

After reassembling the PA and filter boards and connecting the output and ground points, I tried a couple of low power dits and nothing smoked, so I worked the power up, with dummy load connected, and all was well, to a solid 100W. Now that was exciting! Then the acid test, connecting to the tuner and antenna. Well, to shorten this already long story, all was well and I have 100W on all bands!! Boy am I happy!

Analysis:
It appears that Terry was right on with his analysis. When the poor finals started oscillating on frequencies than the set point, they made all sorts of hash and spurs, which I could see on a spectrum analyzer (Thanks, Wayne, for the IFR loan). This off frequency energy was not tuned by the tuner, of course, so the SWR came up, just as it would have if I'd turned the dial.

Why did I have oscillation with the tuner and not the dummy load you ask. Well I asked too and Terry's answer was that the tuner looks flat to the rig AT THE CARRIER FREQ., but not at other frequencies, so off frequency it was very reactive, presenting high impedances at some frequencies and tempting the finals to act up like bad boys.

Thanks:
I've been hamming for 50+ years and have a good grasp of the basics of most of what we do. Most of my experience is tube related, however, so the bahavior of power transistors is a bit of a mystery to me. I assumed the good performance into the dummy load cleared the finals, so I wouldn't have suspected them without Terry's input.

I can read, but was sure having trouble making sense of the biasing procedure in the service manual. It's a great resource, but the procedure writeup could sure use some improvement. I would have been lost in some obscure menu setup mess if Clif hadn't set me straight and told me to ignore the menu stuff and not worry about having the output of the PA open when setting the bias!

So thanks to Terry for his analysis and to Clif for his advice to me and to the many others I see him helping here on the group!

73,
Wilson

Thanks for that. I now feel I "should" have described my problem on the group and looked at some of this first, but didn't know about the group ot think of looking for it. I also felt that after workiing well so long the cause was likely bad components, not design problems. Of course I may have had both. All is well right now, but I'll do some of this stuff when things are not so busy here, like next winter.

Good job writing it up!

10417. Re: [TS-850_450_690] TS-850SAT & G5RV

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-05-26 21:02:57 UTC
From: Mel Cruts
Topic: 10414 Message: 10417

Hi,
I'd expect it to work ok on G5RV. The G5RV I recently repaired by installing a new "Ladder-Grabber" center insulator made the microphone hot (shock) on ten meters. It'd been in a box since I moved to TX from CA 14 yrs ago. It did not have have a choke balun at the transition from twin-line to coax thus allowed the coax feed-line to become RF hot on the shield(common mode currents). I was using a TS-690S/AT to drive the G5RV.

I put a Radio Works Line Isolator in place at the twin-lead/coax transition and grounded the transmitter end of the Line Isolator and that was the end of the hot microphone problem. It seems to tune ok with the internal 690 tuner on all bands from 80 to 10 meters. My G5RV had lowest SWR on 75/80 meters at 3600 Khz so SWR the tuner had to deal with was around 3.5:1 SWR at 3995 Khz.

I would just assume that the TS-850 has an internal tuner with about the same capabilities as my TS-690S/at internal tuner.

Then, I tried the un-thinkable job of tuning on 30, 17 and 12 meters. The G5RV is not designed for the WARC bands. TS-690 internal tuner would not handle the G5RV on the WARC bands. I changed to a LDG KT-100 external auto-tuner and successfully made a match on the WARC bands. Because of the extreme reactive impedance values for the WARC bands, I doubt the efficiency would be any good on the WARC bands but I had to try it just for kicks.
73,
Mel - KF6OZ

Hi folks .. just recently my 850 has started cutting out ..
the RX completely vanishes. when it does this, there is a nouse like a small
relay inside, switching. and that 'relay; clicks again when the set comes back.

and all the while the TX works fine. seems to me that possibly the RX is being muted
as if the set was in TX mode.

when the RX is 'off' - in the fault condition, the set's controls work, can change VFO's,
step through memories, the set beeps on key presses, the lot. the PLL doesn't
seem to be unlocked, nor does the set send any error codes. and it doesn't
seem exactly thermally sensitive ... any ideas ?

Topic: 10422 Message: 10422

I just picked up a TS-450S with the tuner and it has a few issues. There is no transmit or receive and the display has shown several different things. It has shown the dreaded dots, hit has shown 8.050, occasionally, a complete frequency will display, but most of the time it displays 0.0 khz. The LSB, USB, CW, and FSK lights are all lit as well. I am guessing the PLL is out of lock based on what I have read. I checked TP3 on the PLL board and it reads 5.02 volts. When pressing the UP or Down button I also hear relays clicking.

Any pointers on where to start or what else to look at?

Thanks,

Jamey WR4JW

Pull the control unit and pray you can fix all the damage caused by the leaking battery.

The control unit being the board labelled X46-3120-00? A previous owner has remote mounted the battery to an empty area in the bottom where a filter would be installed. It is wrapped in black tape and has double-sided tape holding it to the board. In any event, the board is exceptionally clean...but... The trace from L4 to D2 has been stripped of the green coating and is bare. D2 doesn't even look like a SMT diode to me (looks kinda like a wire wound resistor) but it doesn't look bad either. It also affects on end of R112 and pin 28 of IC3. All connections appear to be ok but I also have discovered I need a good magnifier (didn't realize how much my vision had changed over the last few years).

Jamey, I can't help you much with your radio's issues but when you commented on needing a magnifier, I thought I would offer this as it is a BIG help for me when dealing with SMTs: My local wal-mart (optical department) has a wall of goodies for us who can't see anything......even if it's right in front of us! I picked up a hand held lense that is almost an inch and a half thick and is roughly the size of hocky puck. This thing is awesome for picking out the finest of detail on those boards! You will even be able to see if a trace is broken , if a solder joint is good, " jumpers" in the solder and even the fine fibers left behind by your Q-tip !
It works best for me to place the board on the bench (that way it's steady, not like my hands after a pot of coffee) then, I put the lens right up close to my eye and scoot my face down close to the board. A small light helps too!
I don't recall how much it cost but I know it wasn't expensive.
Hope this helps.
Dan

The best vision help IMHO is the OptiVISOR. The manufactures' link is below
You can get them at a good coin, stamp or hobby shop. I bought mine at a gem
and mineral show. Many tool room machinist use them also, that is where I
was introduced to them years ago. I would not be without mine. They are
available in different magnifications and focal lengths and you can change
lenses if needed. OptiVISOR is a precision binocular headband magnifier
which permits unrestricted efficiency while reducing eye strain, leaves both
hands free, and allows three dimensional vision. Used by anyone whose
profession or craft requires close accurate work. Can be worn over
prescription or safety eyeglasses.

Usually there are bad traces under IC3. Do an ohmmeter check from IC2-IC3 and I think you will find open traces.

Do you know the exact source of your noise? I mean, the exact spot that's generating the noise?
Where are you located? Are your power lines above ground, or fed from below ground? May I ask how you know it's power line noise, as opposed to coming from another source?
Milt.

Yes noise blanker has been done. I know it is the power lines. I have high tension lines located in my back yard. It hasn't been bad until lately. My Icom IC-765 has 1 s unit of noise while my 850 has 4. The receive on the 765 is fantastic.

Is it the power line insulators? If so, call your power company. They want to know these things. Could be dirty insulators or arcing insulators.
I had a similar problem, called Southern California Edison. My electrical utilities come to my qth underground, but he found a power pole 3 blocks away that had quite a bit of noise. They cleaned the insulators, replaced a few and my noise has vanished.

That being said, if there are indeed bad traces, is the associated circuitry tolerant of short jumpers carefully soldered in to reconnect the circuit paths?

Topic: 10438 Message: 10438

Hello everybody after a national contest on HF this weekend, where everything was ok.
I found that, pressing PTT the radio does not TX, tried keyng in CW and also does't work when I click on AT TUNE a morse sound came "CHECK".
Any idea???

The radio: TS450S

Thanks in advance

ct1fac / Fernando

Greetings

my 6xxxx series TS850 pretty much sat on the shelf until I put it into service just about a year ago.

The clock battery is showing no signs of expiring - should I be worried and just replace it - because ???

I'm new to the group as I've just picked up a TS-450, a rig I've always been drawn to from my days of playing with it in the EEB showroom in Vienna Virginia many years ago. I especially liked the quality of the audio.

The new (to me) rig seemed to work fine for a while and then the audio dropped way down and became distorted. I got that feeling in the pit of your stomach you get when you know you're going to have to send your baby off to a complete stranger and hope she comes home all better.

But just before I was going to put out a plea for a competent service person, I thought I'd check the group's archives... and there it was! The discussion of C104 with beautiful photos from KB1OX. I thought what the hell, and opened her up. When I pulled that cap, the black goo on the bottom looked JUST LIKE THE PHOTO. So I unsoldered the original, rooted around in the junk cap drawer for a used replacement, soldered it in and -- budda-bing. She sounds good as new.

Hey thanks to all of you and keep up the good work. Much appreciated.

Larry N3OJD

Now while celebrating; Did you clean all that goo off the board? If not then it will destroy traces and thru holes leaving you with more problems than just low audio.

AGC going crazy, pinning s-meter, loss of rx when that happens.
Loss of RX audio.
Low or no TX power in SSB.

Need I go on? There are several control lines in that area.

That's kinda like cleaning snow from your sidewalk with a leaf rake. You can get most of it but there is still some left. It needs to be chemically cleaned.

A lot of hams may holler foul but the best I have found for cleaning boards of whatever is generic carburetor cleaner from the auto store with a tooth brush for polishing. Just don't get it around any plastic like the front panel or any paint. It melts it. I remove the board from the radio, hose it down, brush it, and hose it again and let it air dry. Cleans electrolytic goop, rosin flux, and about anything else.

If you use that it is at your own risk, just passing along what I have found works.

Clif

PS: Probably not environmentally correct but then I'm not politically correct either....

10451. Source for a replacement front bail TS-450S?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-06-08 20:03:19 UTC
From: Frank
Topic: 10451 Message: 10451

I just purchased a TS-450S from another ham. He had it mounted in a camper and the front tilt-up bail is missing. I've check Kenwoodparts (both East and West) and it's a discontinued item. Outside of buying a "parts rig," does anyone know of a source for a replacement bail?

Just had it a couple of weeks but, with extra filters installed, it is a sweet RX and I'm getting great reports on TX with a Heil mic.

Frank

10452. TS 850 Antenna Tuner

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-06-09 14:18:22 UTC
From: n5rk@ymail.com
Topic: 10452 Message: 10452

On 75 meters, the antenna tuner tunes the antenna down to a low swr but will not stop tuning. I can stop it by pressing the tune button or rotating the carrier control counter clockwise. It works fine on the other amateur bands. Is there an adjustment for this problem?

My actual email address is N5RK@.... I monitor the posting but have not posted myself for several years. Yahoo gave me a new email address because I did not remember my password.

Thanks, John N5RK

10453. Re: [TS-850_450_690] TS 850 Antenna Tuner

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-06-09 16:56:22 UTC
From: Zack Widup
Topic: 10452 Message: 10453

I have had this problem, too. When the antenna isn't QUITE within the range of the auto tuner to match, it won't bring it into the range where it will stop tuning.

I have used three solutions for this:

1) Put up a different antenna for 80. I made a shortened dipole, loaded with coils in the antenna wires. I couldn't fit a full length dipole in my yard so had to settle for one that is 80 feet in total length.

The article I used to design my antenna is in QST, October 2003 p. 28 by Luiz Lopes CT1EOJ, "Designing A Shortened Antenna."

2) Put the tuner in manual tuning mode per the instruction manual and settle for as close as you can get to 1:1 SWR by manually tuning the controls.

3) Use an external tuner that has more range than the TS-850 built-in tuner. Most of the MFJ tuners seem to do fine.

I had a similar problem, but on 15 M with my TS-850S and a G5RV antenna. I recently acquired a Kenwood automatic AT-250 tuner to "help" the 850 tune 15 M and they work great together to tune 15 M. If you look inside the AT-250 you will be amazed how well built this tuner is. Plus it has iputs for 4 antennas. Look on eBay they are selling for $200+.

I believe the entire line of 430/440/450s components use the tilt up bail. You may want to check this out. Of course the 450S probably uses a wider one then the components.

Hey, You would be well advised to put an antenna analyzer on the antenna and determine what you are asking the tuner to do. They do have a finite working range.Sounds like you are right on the edge. If it will not quite tune a small adjustment of the antenna may be needed. Hopefully you know somebody with an analyzer. Good luck.

I had another TS-850SAT which I sold and it tuned the antenna just fine, so does my TS-870. The antenna is a full size inverted "V" for 80 and 40. I used a TS-820 and a SWR meter when I originally put the antenna up. I was able to achieve a 1:1 at 3940. I want to sell this TS-850 but I want to make sure everything is working correctly. I thought maybe there was an adjustment to correct the problem. Thanks for ur help. John N5RK

You can try changing the length of the feedline. It won't change your SWR but it could change the L and C to something the tuner can work with.

10460. TS 850 + G5RV + Antenna Tuner ..OT?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-06-10 03:47:55 UTC
From: dave schertzer
Topic: 10452 Message: 10460

Hello Gents,

I have a question for the group but might be a bit OT. I was going to attach one end of my 102ft G5RV, but now things have changed with the org. location.

To make things work I need to "cut-off" 6ft from one end or (3ft each side) to attach the ends.

Will this really effect the performance? I mostly use 20+80m, but use other bands on occasion.

Running a TS-850SAT with the internal ant tuner.

Comments? Thanks

If I had a choice I would not shorten the elements but try to find a way to tie up the excess length somehow. Tie it up inside the space you have and let the slack droop down or tie it back somewhere.

After reading the replies, I have a question.

It would seem to me that, if the tuner 'tunes the output to a low SWR', what is the problem with going ahead and operating with that setting?

I've had similar experiences; the tuner cranks until a very low swr is indicated. Then I operate. Everything *seems* to work OK.

Do you think this 'tuning spot' is abandoned once the button is pressed again? In that case, I may be shortening the life of the final transistors on my 850.

Hello, I agree with va3ue, don't cut it. The G5RV antenna was designed to
be used with a tuner and not resonant on any band. Therefore you might
still be able to tune with the 6 feet cut off to some of the bands. Trouble
is we can't guess what you might lose. That is the risk. Won't hurt anything
to let the excess ends hang down or take a slightly circuitous route to use
up length. As always this is a moving target and you just have to try
things until something works. Good Luck

Hello, I don't see a problem trying it. Just start with lowered power and work up while monitoring the SWR and power out. If all the power you expect is indicated then things are good. If not, then power is going somewhere else and that is bad. SWR should look bad if that is the case though. My rule of thumb is to get any antenna system (coax, tuner, antenna) to below 1.6 SWR using my analyzer. Then I am confident that the tuner will be able to do its job. You can do the same without the analyzer as suggested above. Good Luck!

I did replace the K-104 relay and the C31 the 56pf silver mica cap. I also replaced the back up battery. I'm happy to report the tuner is working great. The dummy load goes right down to 1:1. The antenna is 1.25:1 with no tuner. Hit the tune button and it drops to 1:1. Thanks all for the excelent advice. I'm sold on this news groups stuff, never did this befor but the advice was first class. I will be reading much more here.

Date: 2011-06-12 16:37:35 UTC
From: John
Topic: 10466 Message: 10466

Hello Group. I just bought a 450s. The seller said it was working. After shipping ups it does not transmit. I found an unpluged coax in the filter section. Now it shows transmit on the rig's meter but external meter nothing out. I think it previously had an internal tuner...the resistor (w5 i think) has been clipped and the leads soldered back. I suspect shipping or removal of the Antenna Tuner are cause of problem. Suggestions? Thanks John

I've shipped a few of the 450S' around and they are pretty sturdy so I doubt shipping was the cause (unless it had inferior packaging). If the internal cables were such that there is no way the radio could have worked I would at least contact the seller and ask for a refund and if that gets you nowhere file a complaint and leave negative feedback on whatever site you bought it from.

Sorry I can't help with the technical aspect. I just hate dishonest people.

> > > > > > >
> > > > > > > I have the CAR control up still no good. The thing is this ts450 will tune everything except 20 meters. It tunes the other bands but it seems to take 2 tries. 1 attempt will be OK but a second time it will bring it down to 1to1. 20 meters doesn't work no matter what. It makes the SWR terrible.

Did you check the menu and make sure the transmit inhibit is not on?

You have to go to menu number 19 and make sure it is not disabled. 73
Tom W7WHY

Hello Group. I just bought a 450s. The seller said it was working. After shipping ups it does not transmit. I found an unpluged coax in the filter section. Now it shows transmit on the rig's meter but external meter nothing out. I think it previously had an internal tuner...the resistor (w5 i think) has been clipped and the leads soldered back. I suspect shipping or removal of the Antenna Tuner are cause of problem. Suggestions? Thanks John

Thanks Tom. I've ckecked menu item 19 even tried it both off and on. Also checked all menu items...they seem to be set at default which I think should allow it to transmit. I've tried it with 2 atus and 2 antennas to be sure, my old ts 430s works fine with them. Thanks again John

If the internal meter shows power out check the pigtail going from the filter board to the back of the SO239. They frequently break.

W5 is resoldered when a tuner is removed, that is correct.

Thanks Clif I'll give it a close check AO. On removing internal tuner what effect would it have if the resistor was removed and the wire leads soldered together. John

There is no resistor. A quick check of the service manual shows W5 is a jumper to connect the 2 tuner jacks when a tuner is not installed.

OOps. I checked the tuner install in the manual, thought is was a resistor. Proves memory is the second thing to go. I checked the so- 239 it looked OK but I resoldered the center conductor in case of a bad joint. My MFJ 969 went to almost 5 watts for a few seconds then nothing. I live in Joplin MO and i have been reminded how many good people there are. Thanks Group John

If you pull on the wire coming from the SO239 I'll bet it pulls out of the circuit board.

John tried reaching you- the radio arrived back and I just had it on the bench- that rf plug you had trouble with... well ya snapped the tip off of the connector somehow.It was clearly crushed and missing- I removed the plug and temporarily hardwired it to the rf connector on the board-- I sent you pics of the missing tip and disassembly in addition to pics of the radio with 100W out both on the 450 meter and a Bird 43. Just had the radio on 20m with the usual great audio report etc... I dont have those mini rf connector plugs here- you'll have to get one and replace it- or solder the cable to the connector and keep it hardwired.
Try and touch base with me when you can as I am leaving thursday and want to make arrangements to return the radio to you. Posting this here in case youre here vs emails.
Thanks
Joe N2GBT

10477. Kenwood Ts-450s intermittent transmit

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-06-27 16:57:44 UTC
From: AndrewN
Topic: 10477 Message: 10477

I have a kenwood ts450s that had no transmit output period. I found some burnt components on the HF final board: Q1 (2SC1971), R5 (5.6 1/2W), and C63 (470p). I replaced them and when I try to TX the TX light comes on for a split second and then the AT Tune Light comes on for a split second and then nothing. It does the same thing whether I use a dummy load or the vertical whip that I have. does anyone have any ideas on what else i might check?

10478. TS-850S TX Distorted / Off frequency

Yahoo group: TS-850_450_690 (2010 — 2016)

My TS-850 had been in storage for almost 9 months, I took it out for Field Day for mobile operating using a deep cycle battery for power. I received reports that my TX was badly distorted and or off frequency. Receive was fine. Using the MONI function, my TX audio sounded fine. I tried the usual fixes for field operating, relocating the power cable, antenna cable, and a different mike. As a last resort, I tried a CPU reset. Nothing worked. Are there any messages that address this issue? If so which messages? Any ideas where I can look for the problem? I suspect that perhaps a TX VCO may be going, but sisnce it occurs on all bands, I'm not sure where to look. The rig was purchased new in 1992.

It could be the dc-dc converter board- they were known to be problems in earlier 850's-- but not sure if that effected the audio or not- lemme do some research ive seen that problem before on a few 850's Ive owned

hmmm I am remembering now replacing a vco trimmer cap years ago on an 850-
theres a test point for the reference voltage and this trimmer cap went bad
and had no effect-- i THINK I had distorted audio until I did th repair-
I'll check my notes when I get home

Perhaps RFI??

Don´t know if you are able to test it at home, try and see if it behaves
the same...
Even better....try a dummy load...

Topic: 10482 Message: 10482

Guys, The only complaint I have about my 850, which I've owned since 1994, is the low volume of the CW side tone. I have adjusted it to full volume as per the manual but it would sure be nice if it could be a little louder.
Does anyone else have this complaint?
Any ideas on this?
Thanks, Bob WE6C

Hi all!

Just need some help here.

A few days ago...

* When I transmit RTTY FSK power goes up & down, between +- 100w to 60w. It is not a continuous signal.

** When I RX after a few seconds the signal disappears. I TX a little and it comes up.

Very strange...

Any help is welcome.

Many thanks.

Nuno

Hi

I'm not sure about your '850, but my '450 doesn't work well with lower voltage. It seems to perculate best at voltages of 13 or better. If it gets down to 12, I get a really bad chirp.

You might try it on a regular power supply before you start tearing into and see if it isn't just low voltage from the battery. I use my '450 in my camper, but I use 2 big batteries in parallel. 73

* When I transmit RTTY FSK power goes up & down, between +- 100w to 60w.
It is not a continuous signal.

** When I RX after a few seconds the signal disappears. I TX a little and
it comes up.

Very strange...

Any help is welcome.

Many thanks.

Nuno

You might also want to be sure it wasn't simply RF getting back into the gear...You wouldn't be the first nor last FD Op who has had RF issues... Just a thought...

I had a similar problem with my radio. Clif told me how to test it. I
can't remember. But, that is what it was, DC-DC board. I sent it off
to him and it came back working like new.

10488. TS-850SAT

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-06-28 00:13:36 UTC
From: akipete
Topic: 1009 Message: 10488

Hi All,
I powered up my TS-850SAT yesterday after a few months of non-use. The screen is blank. The TX and RX is OK but I am flying blind. Any suggestions on where to start looking? I have seen a cap can leak and cause corrosion, but before I look at that, I was hoping to hear of a more likely and easier solution. I left the 850 on receive for a few hours yesterday and the display did not come to life after a long warmup period, and a few slaps n taps on the sides and top.
Peter

It's most likely the cap you've heard about. It was on mine.

N7DLV,
Check it on a power supply low voltage will distort the audio on tx. Also check the power cord fuse holders they can get corroision in them and cause a voltage drop on tx. If all of those tests fail to fix the distorted audio then check the driver and final transistors, I repaired a friends 850 that had a driver and 1 final that was bad that was showing the same symtoms. My guess is it was a low voltage though.

Check C-18 on the display board most likly that is bad and has leaked on the board. Clean up the mess and repair the traces and replace the cap and it should be just fine after that.

Hello Tom; Thanks for the idea. I did measure the battery voltage and it was 12.6VDC. The voltage at the radio connector in CW TX was 12.3 well within the + or - 15% specs. A friend has a receiver that I can borrow to see if the problem is not present at 13.8VDC.

Hi

I'm not sure about your '850, but my '450 doesn't work well with lower voltage. It seems to perculate best at voltages of 13 or better. If it gets down to 12, I get a really bad chirp.

You might try it on a regular power supply before you start tearing into and see if it isn't just low voltage from the battery. I use my '450 in my camper, but I use 2 big batteries in parallel. 73
Tom W7WHY

My TS-850 had been in storage for almost 9 months, I took it out for Field Day for mobile operating using a deep cycle battery for power. I received reports that my TX was badly distorted and or off frequency. Receive was fine. Using the MONI function, my TX audio sounded fine. I tried the usual fixes for field operating, relocating the power cable, antenna cable, and a different mike. As a last resort, I tried a CPU reset. Nothing worked. Are there any messages that address this issue? If so which messages? Any ideas where I can look for the problem? I suspect that perhaps a TX VCO may be going, but sisnce it occurs on all bands, I'm not sure where to look. The rig was purchased new in 1992.

Perhaps I should rephrase my response. A friend has a receiver I could borrow, so I can listen to my TS-850 transmitting into a dummy load, while the TS-850 is on 13.8Vdc so I can see if the problem is not present.

I remember this also- ran my 850 at 14.2v volts- had to adjust the output
in the ps but there was a rheostat for that

Ive read that if the dc-dc converter boards start acting up sometimes the
increase in voltage can buy some time

Hello, According to my son Greg, W6GMJ, who just recently bought a TS-950SD, those are better than the "X" model. Apparently the "X" upgrade was not a good thing. Look him up on QRZ.com, he would be glad to give you the details. These are great radios, a little on the large size, but great otherwise. Good Luck

I am inclined in the 950SDX because my research on the subject has found out that the TS-950sdx is supposedly superior than the older version "SD" because:

1) It has a different, better, and simplified front panel layout and
greatly improved operating software.
2) It has an FET final power amplifier (the 950SD was bipolar, and not reliable).
3) It has a fully adjustable display dimmer.
4) It has all the great features of the TS-850S which were lacking from the TS-950SD, including the CW REVERSE function, the CW FINE function,the better frequency synthesizer which tunes in 1 Hz steps (the 950SD was 10 Hz), and the 850's Quick Memo function, which supposedly is extremely handy.
5) It also has automatic AGC available.
6) It has a menu-configurable IF filter selection feature, so you can
bypass filters you'd never use on certain modes.
7) It's got better DSP (the DSP in the 950SD was marginal).
8)It's got far better "second receiver" functionality.

As I have not had the personal experience of comparing both radio or having the technical specifications to compare them on a one-by-one basis I am still open for someone to validate or challenge these arguments that I got from the web.

Best,

WP4IDK/5

By the way.. As soon I posted in different ham radio websites my intention to buy a TS-950SDX, I have received five e-mails from outside the US offering me "dream" TS-950SDX radios at ridiculous prices.

Three from the UK,
Two from Italy
One from Canada.

All of them of course asking to be paid by Western Union..

Go figure... hmmm..

Unless it's on eBay and the person has sold things already with a good feedback rating (>97%) or it's someone I know personally, I wouldn't buy it unless I could call the person on the phone and speak with them directly about it.

I guess some of us who have purchased things over internet for a long time have developed a "feel" for the scammers. I haven't been burned in years. Last time was someone on a ham radio group who sold me a HV transformer for $60. I never got it. He claimed he had shipped it but didn't present any sort of tracking number and kept my money. I just wrote it off to a lesson in life in that case.

If I'd lost the $800 I spent for the mint condition 850 I got, it would've been a different story.

I've had very good experience with buying radio's on eBay.
One thing I might add, on the eBay Feedback subject: I look for 100% positive feedback.
I don't make many high dollar purchases, but my money for radio's is as important to me as it is to you also.
Just be careful. Check out the seller. Check out his Feedback to see what he's been selling in the past. Communicate with him as you would do if it was a retail outlet.
Just as important as the radio and it's advertised condition is the seller's return policy.
BTW, I got a truly mint TS-850SAT, a matching SP-31 speaker and a Heil Pro Set Quiet Phone headset for $850 + $40 shipping. Was that top dollar? I suppose so, but I'm happy. the seller got what he asked for the radio and if both are happy, it's a good deal.
Just my experiences.
Milt.

Just to show you how often I check out the group (not)....

I had to pull the LO2 VCO module as well. I could have replaced the trimmer with a like one, but I had already ordered a couple of glass piston caps - and I liked the idea of having multiple turns (instead of only 180 degrees).

I am now having a problem that I think is VCO2 (not LO2 VCO) - if I end up having to change that cap as well, I think that I will go ahead and change all of the trimmers. I haven't tried adjust the cap yet - thought that I would wait to hear from some of the gurus on here.

Of course, it would have to happen during the RAC contest

Not everybody has a 100% feedback rating. Sometimes there are buyers who are bad apples, too, and have to complain about something. I have never had trouble with those having a 97% or better feedback rating.

I've gotten some incredible deals at eBay. One hint - look for auctions that end over a holiday, like on July 4. From my experience, there is less of a chance of someone who is bidding being at his/her computer when it ends on a holiday. One of those little secrets.
:-)

I wrote an article on eham awhile ago on 15+ years of horsetrading--

Even when you think youre covered- you may not be-
here's a brief example

You sell a 500.00 radio to someone in S America- via ebay- using paypal.
The radio ends up in customs- and the buyer decides- he dont want to pay
customs fees- he totally forgot his country adds 20 per cent duties to that
radio- so... he never picks it up/

He files a paypal dispute- item not received- and guess what- EVEN though
he never picked it up- paypal's position is: buyer never got radio he's
entitled to a refund

Now- what about getting your radio back? Good luck. Paypal's decision is
soley based on buyer NOT getting the radio. IF he got it- he would have to
send it back as an item not as described dispute. But because he doesn't
physically have the item- and it doesn't matter WHY- youre screwed.

Or-- someone buys a radio from you- swaps out main boards because he has
the SAME radio and needed a board- then disputes the item as non working. You
loose.
Oh.. you say-- you sold it AS IS- NO RETURNS---- youre covered.
Wrong.

By carefully wording your ad you can cover your ass- but the wording HAS to
be right

Pick up the phone- call the seller/buyer- get a feel- google the name and
callsign. do your legwork.
You will get a painted picture of the seller with a bit of research.

Ive been lucky in 15 years- but I follow my rules and NEVER deviate.

Joe, As you said in different words below, the sellers have basically no rights, and the buyers have all the rights.
Your example below is why most will not ship outside the lower 48.
I have also heard that until the buyer gives you, the seller, a pos feedback, you don't get your money??? Is that right? Or something like 30 days goes by???

Sellers cant leave negative feedback especially as retaliation. Buyers can leave anything they want.
We sell on Amazon here- and Amazon ONLY cares about BUYER SATISFACTION. Anything wrong- the seller must handle it. Ebay is the same. It's a proven business model based on sheer numbers.
Ebay is no longer the venue where anything goes. It looks out for buyers- and offers them amazing recourse- to the tune of allowing fraud and deceptive buying practices to flourish.

I am not saying its predominant- but if you know how to play the system- it will work for you as an unscrupulous buyer.

As such- intricate scams evolve that work within the environment of Ebay etc. and soon carry over to QTH and other swap boards.

Bottom line is- you leave yourself open to the pitfalls and scams IF youre not careful.
A seller can choose his buyer- if someone buys something from me with -feedback- or no feedback- or I got bad vibes I cancel the sale. I never buy using a USPS money order. Personal check or paypal.
Primarily because I run a busy company and there is NOTHING in this hobby -especially used- I need bad enough to stand in line at the Daytona Beach PO for an hour LOL

If you want to trade with me and you have no track record on the net- send me your item first. I have 15+ years of positive performance to read up on. If you dont- that's how I do things.

If you've sold 800 ham items on ebay or qth and its there to read- it's different- it means youre a horsetrader like me and different strategies will apply.

ive seen estate sales- no means to test- no antenna etc and if you go back and read- the guy is an avid ham--

I can test anything to make sure it works with a dummy load and a hunk of coax.

BUT... I still believe that our integrity as a community is still well intact and this is the exception rather then the rule. I just elect not to make exceptions to my rule(s) :)

This is always a good topic to get me going on LOL

Joe, As you said in different words below, the sellers have basically no
rights, and the buyers have all the rights.
Your example below is why most will not ship outside the lower 48.
I have also heard that until the buyer gives you, the seller, a pos
feedback, you don't get your money??? Is that right? Or something like 30 days
goes by???

I wrote an article on eham awhile ago on 15+ years of horsetrading--

Even when you think youre covered- you may not be-

here's a brief example

You sell a 500.00 radio to someone in S America- via ebay- using paypal.

The radio ends up in customs- and the buyer decides- he dont want to pay

customs fees- he totally forgot his country adds 20 per cent duties to
that

radio- so... he never picks it up/

He files a paypal dispute- item not received- and guess what- EVEN though

he never picked it up- paypal's position is: buyer never got radio he's

entitled to a refund

Now- what about getting your radio back? Good luck. Paypal's decision is

soley based on buyer NOT getting the radio. IF he got it- he would have to

send it back as an item not as described dispute. But because he doesn't

physically have the item- and it doesn't matter WHY- youre screwed.

Or-- someone buys a radio from you- swaps out main boards because he has

the SAME radio and needed a board- then disputes the item as non working.
You

loose.

Oh.. you say-- you sold it AS IS- NO RETURNS---- youre covered.

Wrong.

By carefully wording your ad you can cover your ass- but the wording HAS
to

be right

Pick up the phone- call the seller/buyer- get a feel- google the name and

callsign. do your legwork.

You will get a painted picture of the seller with a bit of research.

Ive been lucky in 15 years- but I follow my rules and NEVER deviate.

w9sz.zack@... (mailto:w9sz.zack@...) writes:

Unless it's on eBay and the person has sold things already with a good

feedback rating (>97%) or it's someone I know personally, I wouldn't

buy it unless I could call the person on the phone and speak with them

directly about it.

I guess some of us who have purchased things over internet for a long

time have developed a "feel" for the scammers. I haven't been burned

in years. Last time was someone on a ham radio group who sold me a HV

transformer for $60. I never got it. He claimed he had shipped it but

didn't present any sort of tracking number and kept my money. I just

wrote it off to a lesson in life in that case.

If I'd lost the $800 I spent for the mint condition 850 I got, it

would've been a different story.

10515. Field Day TS-450 Logic FREAK-OUT!!

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-07-01 21:02:48 UTC
From: Ron
Topic: 10515 Message: 10515

This last Field Day operating the 20-m CW station from W6SW, several hours into the event, my TS-450 starting "freaking out". Some of the button's stopped working, altho I was able to press-tune and have the radio go into tune mode. I couldn't change the filter settings, although I have all filters installed for 8.83 and 455.

Within a matter of minutes the tune button would no longer work.
I could transmit OK and switch between VFO and Memory mode, but could not change to different memories. The M->V no longer worked. The filters were stuck at 6khz and 2.4khz respectively; however switching to a memory channel would change the filter settings stored in that channel. I could invoke the various menu modes from startup but could see nothing amiss.
I ended up swapping out the radio in favor of my ICOM 7000.

Has anyone ever encountered this? Instinct tells me it is probably something simple. Do you know where I should begin looking to resolve this problem?

Curiously,
Ron

Nope - not the PLL VCOs - although I did tweak them...

Topic: 10515 Message: 10519

Well for me it looks like a coming total failture of the digital unit of the TS-450 - which seems to be pretty common. It started almost similar with my rig e.g. some functions went down incl. filter settings until within 2 month the rig was totally unuseable. Tried to fix the digital unit e.g. all supply voltages were there, backup battery voltage etc. .... but then your are at the end with limited test equipment.

Fortunately manage to get an replacement of the digital unit - after 3 years of waiting and supplier search - this unit is unfortunately sold out with Kenwood and the service centers worldwide, good scource are departed rig's which are sold in parts - sometimes on online auction platforms.

Well the good thing is my rig is working again .... I keep my fingers crossed I hope you will have the same luck like me.

When I hear "digital unit" that confuses me as the digital display is working fine; it's "only" the buttons which are not responding.

Can you clarify?

Curiously,
Ron

While not as commonas the 850 the batteries in the 450 have been known to leak. They damage traces. Several data lines run under and just below the battery which when intermittent can lead to all kinds of different symptoms.

Check the battery first.

Clif

I have yet to open up my TS-450.
Is there a writeup somewhere that describes how to change the battery (meaning how to locate it inside the radio)?

Curiously,

Hello

Can someone help me.

My TS-850s put out only the parts of the left of the display.
Where brand power, ALC and SWR.

How do I solve this problem.

<Quote>
Tilt the front of the radio down (after removing covers of course).
Remove the display unit. In the middle of the backside of the board
is a large electrolytic cap (C18 IIRC). Replace it and repair the
damaged traces AND thru holes the acid damaged. Don't forget the thru
holes. Also one leg of the cap has it's connection under it. Trace it
out and jumper because the hole under it is usually no good.

I had a similar problem with my radio. Clif told me how to test it. I
can't remember. But, that is what it was, DC-DC board. I sent it off
to him and it came back working like new.

Bought ne of these and it arrived yesterday.
Digital Master 780 is ok.
Got CW working by setting DTR and RTS on COM6.
Got PTT working for AFSK with RTS on COM6.

Trying to get the CAT interface running (COM7) in Ham Radio Deluxe. The CAT cable passes loopback test fine and it appears to be wired correctly to the ACC1 socket.

Is there a menu option in the TS-450S I'm missing that turns this feature on? Otherwise I'm looking at a problem inside the rig. Perhaps a bad IC12 (SN74AS04NS)?

Has anybody had this kind of difficulty like this?

Thanks in advance.

Daniel

What baud rate are you using for the ts450

4800, 8,n,2 is most common for all kenwood (that I have seen), is that your settings (cat settings only)

From: VA3UE
Topic: 10529 Message: 10533

Yes,

The HRD connection wizard knows it's 4800 baud based on the model of radio from the drop down. I've even hooked up to the com7 port with Putty at 4800 8N2 and still nothing. I send the simplest command according to the interface manual "ID;" and no response.

In the meantime I hooked up an old scope to the TX & RX data pins on the din connector ACC1 while the CAT interface was connected and I see square waves going in when I type a character via Putty. However at all times (typing or not) there is data coming out of the output pin from the radio regardless of mode or squelch or volume or any setting that comes to mind. It looks like it is streaming data constantly. I have no way of knowing what baud rate it is or if it is inverted since it is a constant stream.

Might there be somebody in the Dallas Texas area with any kind of working CAT connection to a TS-450/690/850 that I could bring my rig over and see if it is my rig for sure?

Daniel

Did you try 'auto-connect?

73
Tom W7WHY

Yes,

The HRD connection wizard knows it's 4800 baud based on the model of radio from the drop down. I've even hooked up to the com7 port with Putty at 4800 8N2 and still nothing. I send the simplest command according to the interface manual "ID;" and no response.

In the meantime I hooked up an old scope to the TX & RX data pins on the din connector ACC1 while the CAT interface was connected and I see square waves going in when I type a character via Putty. However at all times (typing or not) there is data coming out of the output pin from the radio regardless of mode or squelch or volume or any setting that comes to mind. It looks like it is streaming data constantly. I have no way of knowing what baud rate it is or if it is inverted since it is a constant stream.

Might there be somebody in the Dallas Texas area with any kind of working CAT connection to a TS-450/690/850 that I could bring my rig over and see if it is my rig for sure?

Daniel

If you mean auto-detect yes. None of the flow control options make a difference nor should they since there are only 3 wires going to ACC1, txd, rxd and gnd.

From: VA3UE
Topic: 10529 Message: 10536

The radio is sending data out pin 2 of the ACC1 constantly with no input requests.

Here is a link to a picture of the scope on pin 2, the data out.

http://dl.dropbox.com/u/3222301/IMAG0223.jpg

0.1ms per horizontal division
1V per vertical division

I've looked at the output buffer inverter chip and there is signal going into it just like this (inverted of course). That chip is fed by IC1 (a big one). There must be a menu setting I'm missing that has some feature enabled that it is doing this.

Any ideas?

Thanks
Daniel

10540. TS-850SAT + DSP 100 Problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-07-09 03:25:13 UTC
From: dave schertzer
Topic: 10451 Message: 10540

When I use the DSP-100 on RX only and the TS850SAT it works GREAT !

When I use the DSP-100 (TX- In) and the TS850SAT tuner will NOT tune???

What am I doing wrong?? Checked all conections and manual???

Thanks

10542. TS-430 basket case

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-07-09 18:14:06 UTC
From: cintrans
Topic: 10542 Message: 10542

Hi all,

Someone donated a well beaten-up TS-430 to one of the local HAM's, who at his turn brought it to me to put some life back into it...

I have it hooked up now and it seems all switches and knobs are doing what they are suppose to do (after some contactspray...), i have RX and TX, but with two issues:
I dont have VFO (no, its not locked), when i spin the knob the freq is not changing, but it does when using the up / down switches on the mic. I am guessing the optical reader went QRT??? Any thoughts on this???
Second issue is when advancing the carier (on CW) or the mic (SSB) over half way and TX'ing (into dummy load) there is something that could be described as RF getting back into the rig... all led's start blinking on the rithm of your TX signal... i have no idee where to look to solve this one... anyone with usefull tips on these 2 issues??

Hi Dave

Turn up the "CAR" level on the DSP-100. If you switch on the DSP it cancels out the CAR setting on the rig.

Cheers

Could somebody possibly tell me if I can do anything to stop the muting of my TS450s in between changing through memory channels when using the M.CH/VFO CH knob, I have 80 CB radio channels in the memory but it's quite annoying that it mutes for a second when I change between each channel. Any fixes or mods to allow the sound to stay "open" while selecting would be appreciated or indeed if this is even possible. Thanks.

Problem solved! All it was was the connection on the back of the interface at the 3.5mm stereo plug had the tip and ring reversed. Thank you to Neil at ZLP electronics for helping me troubleshoot it.

Once I had the wires corrected I was able to communicate with the radio and send "AF0;" (Auto Information off) and the data streaming stopped. HRD connected up fine and turned it back on! HAHA

Thanks to everybody who responded here and privately.

HRD is working! \o/

Hi Group,

I have decided to sell the TS-850SAT I aquired last year, S/N 70300158, which was manufactured in 1995 and has the "newer" DDS chips.

The rig was serviced and aligned by AVVid in early Jan 2011.

Asking $750.00 + Shipping. Please contact me for more info, pics, etc. if interested.

73,
Scott

Hello Group de Kb9kyu, My father (which I've invited
and will show him how to join this group) ab9wg
owns the 690-s. We are interested in learning how
to set it up for computer control. We are also looking to
use it on digital modes as well and are looking
for help on the best way to do this!
FYI, it did not come with add on adapter that
went from the rig to the pc. I hear this adapter is
no longer offered. We see that the dsp100 is scarce and expensive if found. What are some
good dsp units that owners could recommend?

Hi
I have a TS-450SAT (which works the same as the '690) here and I use the CAT controller that I purchased on eBay from G4ZLP. You can also do a Google search for ZLP Electronics. You can go to eBay and Google his call and find his products. All you need is one of his cables.

I have purchased 3 of his CAT interfaces and they work very well and are reasonably priced. I bought one and it arrived in Oregon in 6 days from the U.K. Neal really stands behind his stuff, too.

He makes the CAT cable for either serial or USB ports on the computer.
Not affiliated with his company, but a satisfied customer. 73
Tom W7WHY

Hello Group de Kb9kyu, My father (which I've invited
and will show him how to join this group) ab9wg
owns the 690-s. We are interested in learning how
to set it up for computer control. We are also looking to
use it on digital modes as well and are looking
for help on the best way to do this!
FYI, it did not come with add on adapter that
went from the rig to the pc. I hear this adapter is
no longer offered. We see that the dsp100 is scarce and expensive if found.
What are some good dsp units that owners could recommend?

Yes, I saw a DSP100 recently on sale for $750. Why would anybody buy one at that price when you could put that money toward a more modern rig with DSPs built in. Makes no sense to me. Anyway the DSP100 isn't needed for digital modes.

There are many options for rig interfaces. Some do just digital encode/decode and sone do CAT control as well.

I have a TS-450S and just hooked up a ZLP DigiMaster Pro+, lots of Signalink USB and Rigblaster users around. You might also want to join the Ham
Radio Deluxe yahoo group too.

I use this interface for digital modes. Works great & is small. You will need the TS-690 cable, but some rigs like the IC-746PRO & FT-817 do not need the extra cable.

10554. TS-850 Filters and Filter Switch Settings

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-07-14 23:03:28 UTC
From: k4zot
Topic: 10554 Message: 10554

I own a TS-850 and have just installed a YG-455C-1 filter in position 4 (far right hand side looking with the set upside down)and with YK-88SN-1 in position 1. Position 2 is empty. I get all the lights under the
Filters settings to come on: 6K, 2.7K, 500 and 270 with both the 8.83 and 455 buttons. The filter switch inside the top cover is set to position #1, 3, and 4 ON and #2 OFF. Is this switch setting correct? All the filter lights come on in both USB and CW modes. Is this correct?

Thanks,

Glenn - K4ZOT

10555. TS-690 Low output below 21MHz

Hi All, I have a friends TS-690 on loan at the moment.
Has a very strange problem.
The RF output is only around 20 watts or so till it gets above 21 Mhz. Above that 24.9, 28 etc it's all fine.
Have checked the filter board relays and they seem ok, have tested most for correct operation.

Have searched high and low and can't find mention of this same problem.
Hope someone can shed light on this.
Cheers
Theo

bcc39b,

As Cliff is asking if the rig is drawing normal current for 100W with only 20W out then the rig is trying to put out the normal power, but something in the rig is preventing the output getting to the ant connector.

If drawing low current then the rig is shutting down or reducing the power or does not have enough drive for the PA.

I would ask what is the SWR on the bad output freqs??? I'm sure you checked this, but just to make sure the rig is not shutting down due to bad SWR for which the rig will roll back power to protect itself. I'm sure you checked this, but had to ask, hi.

Topic: 10554 Message: 10558

Glenn, I have all 3 positions filled. Only the light of the filter selected comes on, not all. In other words if I choose the 500hz filter, that is the only light on. Only one light on for each IF. Since I'm at work I have no access to the manual but it makes sense to me to have only the switches that have a filter installed turned on. I do remember that the switches must be turned on when the radio power is off. It sounds to me like you have them correct. Maybe a reset is in order?????????
I won't have access to e-mail for several days but I'm anxious to hear what you find out.

From: Ron Wright, N9EE
Topic: 10560 Message: 10560

hi all,

I have a TS850 with a display problem.

On power up all the characters/symbols come on the display. Like when you first start your car all the idiot lights come on to allow one to check if all the bulbs are good.

Then the display remains in this all displayed state and does not follow the radio's operation. One can tune the radio and move around on the bands hearing various signals, but the display does not change from the power on state.

Any ideas as to where to look or has this problem been seen before???

Yes :-)!

Check my article here: http://jvgavila.com/wb7.htm

As you can see, there is a capacitor in the display circuit which causes havoc on several traces under it. You need to remove it, clean residue with alcohol and fix all damaged traces in the area. It is not hard to do but takes its time.

Regards,

JOSE

Thanks for that,,,the SWR is perfect. Matched in the dummy load or various dipoles. I always work into a dummy load for a perfect match.
My TS440 works quite ok as well.

The 690 draws an excessive amount of current in the affected bands. over 20A and I've even seen it close to 30A at one stage. Once you're up to 24-30MHz it's perfect, draws up to 20A at 110w output PEP.

HI there Cliff,
I did respond earlier but my messages arn't appearing so I'll try to answer again.
Apologies for that.

Yes definately lots of current draw. Even at 25-35w on the lower bands the radio is drawing well over 20A, I even saw around 25 and above...which is way to high for this pa. Up over the problem area, 24-29MHz the current draw is normal at around 20A with 110w pep.
It seems the PA is working well but could be something in the filter board??

Hello!

I would say you have a problem in the diodes of the bandpass filter circuits. A damaged one could cause RF feedback and self-oscillations on final amp.

But Clif is the expert on this :-)!

Regards,

JOSE

Stuck relay, probably K1 or K8. First check on the tuner plug and make sure only one relay is turned on at once. On 80m none of the lines should be high. If so remove K8 and K1 and try it.If OK on lower bands replace them.

My laptop has a built in mic and headphone out and I find the mic in a little too sensitive. I've tried an external USB soundcard on the line input jack and it seems about the same. As a result the receive audio control on my ZLP Digimaster Pro+ is at the bottom of the range and it doesn't give me much room to adjust.

I haven't found a USB soundcard or adapter with a true "line-in" input yet so in the meantime I'll be padding the audio either inside the interface or in-line between the interface and my laptop. If you find a suitable one in your travels please let me know, I'm also interested.

Thanks
Daniel

For digital control I use this interface.

http://www.westmountainradio.com/product_info.php?products_id=pnp

It is small & has a number of different cables for different rigs. Some rigs you don't need an additional cable like the FT-817 or IC-746PRO.

Hi,
Radio Shack sells a audio cable 30 db in-line pad that you can send
audio through and input to either sound card or laptop microphone
connector. That method has worked well for
me in the past with an old Kenwood TS520SE. This should give you some
range of adjustment so you don't feel like it's all or nothing
(digital :-)) adjustment.

My laptop has only a mic and speaker jack and it works fine for me using HRD into an interface made by Donner, N8ST.

Through the volume control, be sure to turn off "mic Boost" in the advanced properties.

I don't know if it makes a difference but I'm using the 450, not the 690.

Frank

For a plug n pray solution I think the Signalink USB is about as easy as they come. Buy the Kenwood cable and you are ready to go. Plugs into a USB port and has a built-in sound card. Interfaces very well with the HRD software, the writer of which lurks around here...

A little over $100.

Clif

Fantastic thanks Clif, I'll get onto those. I did feel them with my finger last week switching ok but not at the same time. I'll go over them asap. Thanks for the advice.

I have a TS-450S that didn't cost too much at all to get going with digital modes. The 690 should be similar.

I soldered together a cable with resister step-down just like this schematic:
http://www.qsl.net/wm2u/images/interface_simple.gif
I used the ACC connection so the hardest part was soldering the 13 pin DIN plug. Haven't found any issues with ground loops or anything.
(probably $5 in parts)

Used with this USB sound card:
http://www.meritline.com/usb-2-0-to-audio-adapter-w-mic-jack---p-27760.aspx
Works great. Just make sure to set the sound out volume low enough to prevent splatter; check your ALC while transmitting to make sure its not flat topping. I find about 75% on the sound out volume is good.
(normally $3, had a coupon at the time from bensbargains.net to make it $1.09, free shipping)

For rig control (and PTT) I use this serial cable:
http://www.hosenose.com/detail.asp?product_id=LCU-3K
($45+$5 shipping)
The only minor issue I have with this cable is I need to set an option of Serial_handshake=none when using hamlib based software. Not a big deal.

Hope this helps,

Don

10574. TS-850 NOISE LEVEL

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-07-23 21:54:56 UTC
From: johnnygm7lsi@aol.com
Topic: 10574 Message: 10574

Hi all,
I wonder if anyone can throw some light on a noise level
problem I have on my TS-850S AT. I have a continuous noise level of 8/9, I used
to blame it on local QRM, but I have now moved QTH and it has followed me.
Antenna just now is a 80MTR dipole, but as I move up the bands the QRM gets
lower, I have changed coax and baluns to try and cure it but it still
plagues me. A friend of mine has brought round his HF rig and there is no qrm
on his radio in my shack, I have also tried a change of PSU. With the AIP on
, IE. button depressed, the QRM drops to sig 4. Any strong sigs of 8/9 I
can read ok but anything below that sig I can still hear but with
difficulty. Hope I`ve covered everything.

Many thanks,
Johnny, GM7LSI. Scotland.

Hi Johny,

This sounds to me like a problem I have had with several TS-850s with
a damaged Q49 transistor on the RF UNIT. It is a transistor which
adds some attenuation on transmission so the receiver is not
overloaded. But if it fails and gets intermittent, it causes all kind
of static-like noises. It is just a 'digital' transistor (with
internal biasing resistors) and very cheap.

I have some pictures of the exact location if you need them.

Regards,

JOSE

Hi Jose,
Thanks for the quick reply. Some pictures to locate the
transistor would be great as I`m not very technically minded, also how to
test it and any values, or maybe I should just change it and see if there`s
any improvement.

73`s, Johnny.

Did you put your radio on a battery and turn off your mains?????? Since
it followed you, it sounds like one of your appliances.

Right now, in the midwest USA, we're in the summer thunderstorm season. Noise levels make 160 meters virtually useless, 80 meters has S9+ noise most of the time, 40 meters has S5 to S9 noise, then on 30m and up the noise decreases. 15 meters and above have very little noise, maybe S1 at worst. Is that what you're experiencing? If so, it's typical summer QRN levels.

Here in Florida we get noise primarily from two sources; electrical power lines and atmosphere I think mostly from the Sun.
The power line noise seems to be mostly from the higher voltage lines. In many areas a broadcast AM radio is covered with noise when close to high voltage lines. I have been told it is due to the insulators being so dry this cause noise. We do see a temp relief when it rains.

When I lived in Ohio during the Fall and Winter months all the bands were free from most noise. During summer it was S9 to 20 over. On 75 had to use a amp running at least 500 W to make QSOs. In the winter 100W was all needed. Here in Florida we have noise all year long.

Another source of noise I experience is from CFL and fluorescence lamps. Also, in a previous residence, a defective circuit breaker caused noise from the internal arcing.

Time to get your rig on backup power and throw down the big switch?

First reset the processor.

Does it go into tx mode just no power out? Band? Mode? On a dummyload?

Thanks for the reply Clif. I tried the reset still nothing. It does not go into transmit at all. Receive's on all modes all bands just like normal. Will not go into transmit. It does have the internal tuner I took that out of line and set it up as if it was never there still doesn't go into transmit. While in the radio I looked around to see if there were any obvious burned components. I did not see nor smell anything.
Thanks
Rick

Ok, let's try this again. Does the red light come on and the rx mute when you push the send switch?

HI Rick

Did you check the menu?

Hold the LSB?USB key in when powering on.

Menu item number 19 has to be set to 'Off'. Looks wrong, but that is the right setting. 73

Did you mention, is this with the hand mike, or are you using the send button to see no transmit???

Sounds like an open mike.

What about cw mode??? With a key

Hi, Sorry for the delay in replying, I`ve been working away from home all week, thanks for taking the time to reply, and all the advice. Looks like it`s just noisy bands then. ,I have done one test with an Icom and it had 0 noise level on the meter at my QTH, but it could be that the TS850 is more sensitive on recieve, I`ll do some comparison tests with other radios and let you all know the results.

Thanks
again, Johnny, GM7LSI.

In a message dated 23/07/2011 22:55:05 GMT Daylight Time,
johnnygm7lsi@... writes:

Hi all,
I wonder if anyone can throw some light on a noise level
problem I have on my TS-850S AT. I have a continuous noise level of 8/9, I used
to blame it on local QRM, but I have now moved QTH and it has followed me.
Antenna just now is a 80MTR dipole, but as I move up the bands the QRM gets
lower, I have changed coax and baluns to try and cure it but it still
plagues me. A friend of mine has brought round his HF rig and there is no qrm
on his radio in my shack, I have also tried a change of PSU. With the AIP on
, IE. button depressed, the QRM drops to sig 4. Any strong sigs of 8/9 I
can read ok but anything below that sig I can still hear but with
difficulty. Hope I`ve covered everything.

Many thanks,
Johnny, GM7LSI. Scotland.

got on six last nite . i use a ts570 and a 5 ele cushcraft ant.
had not been on for a week or so . noticed my power out had dropped
to about 50 watts peak. check all setting and swr and all is correct.
dropped down to hf bands and power out is 100 watts. anyone have any
ideals ? i have the build in tuner and it tunes out what little swr i have

Separate antenna?? Maybe swr is higher than usual. Have you checked it on a dummy load??? I don't know the radio well, but is 6 capable of 100 watts???

Subject: [TS-850_450_690] low power on TS570

got on six last nite . i use a ts570 and a 5 ele cushcraft ant.
had not been on for a week or so . noticed my power out had dropped
to about 50 watts peak. check all setting and swr and all is correct.
dropped down to hf bands and power out is 100 watts. anyone have any
ideals ? i have the build in tuner and it tunes out what little swr i have

10603. NEED 6631 or 66312 DDS chip (used or new)

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-08-15 14:39:58 UTC
From: Jose V. Gavila
Topic: 10603 Message: 10603

Hello!

Some time ago I was able to fix a TS-850 thanks to the help of a list member. This time, a TS-450 has stopped working and it has also the dread damaged DDS chip failure :-(

So, is there anyone with a 6631 or 66312 DDS to spare?. I would even take an unworking CAR UNIT (from a 450/690 or a 850) to salvage one chip. Of course, a working CAR UNIT for the 450 would be a perfect fit, but I am not dreaming on finding one.

Thanks for your help!

Regards,

JOSE

Topic: 10604 Message: 10604

Hi gang I am new to this group.

I finally bought a much coveted TS-450S after selling my TS-440SAT years ago.

I fired it up and tuned and loaded it to the OEN 3980 all was swell. I shut it down for dinner for about an hour.

I fired it back up for net and all was good on the receive had a lot of noise so so I stepped through the NB.

It locked up and would not do anything total time of maybe 5 minutes.

I shut it down and restarted it. Still bricked some goofy lights lit ie. AT TUNE allmodes etc.

Since it had been stored for several years I replaced the internal battery no help.

I have tried both resets. A=B and is it clear and ??? it is the box I am on the road back to Yuma.

All ideas appreciated. This beauty is like new I would hate to part it out.

Had the internal battery leaked? If so did you repair the damage?

After we had buttoned up the rig my buddy, with the steadier hand and better eyes than this 66 year old, who installed the new battery mentioned the battery had leaked down on an ic below it.
In the info I have found online battery leakage and carrier board electrolytics seem to be suspect. I will open it up and take a look for myself.
Are you the AVVID repair person who is doing backlog the next few weeks? If so I have bookmarked your site. So as to contact you after Labor Day when I return to Yuma.

Dennis, Tom has a great idea. The only band I have RF issues on is 40m on my TS-690s, and reducing the power always fixes it.

Hi,

Sounds like history from my shack. When RF comes back down the coax shield strange things can happen in the shack. One situation where I had RF in the shack using a G5RV antenna was easily taken care of by putting a Radio Works ferrite choke at the coax feed point of the G5RV. Although the G5RV was not originally designed to have a choke or balun at the coax/twin-lead transition point, it may often help solve a problem on at least one band where RF on the coax shield becomes a problem.

You may not be using a G5RV antenna, but if RF in the shack the problem that causes your hum problem Radio Works may have a beneficial solution. Their web site is: http://radioworks.com/

Try a 40m counterpoise ("tuned" ground).

The TS440 was especially susceptible to rf problems on 40m. Usually caused by several factors. Inverted "V" antenna with an end close to the shack combined with using a full length power cord to a power supply on the floor. Run the numbers on the power cord length vs frequency. Most hams are reluctant to cut the power cord (me too). So...

Not much can be done about the antenna but I have found that the split ferrites sold numerous places work wonders. I use 3 of them on the power cord right at the back of the radio. By careful manipulation you can make a turn thru them. That usually takes care of it.

Realize this is common on the 440. I haven't heard much on the 450 and this problem but where it's limited to 40m only it won't cost much to try.

YMMV

10616. A "highly technical" solution to my "hummm on 40 problem"!!

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-08-25 16:31:46 UTC
From: Dennis
Topic: 10609 Message: 10616

OK, so technology isn't new to me. I've been a ham since 1953,so I thnk I know enough to get on the air and have some fun.

A couple of days ago I asked the group a question about "sidetone hum on 40 meter cw".. And I want to THANK the guys who replied to me.

I have since FOUND THE PROBLEM and thought I'd report this "highly technical" solution to the 40 meter hum problem.

First you need to know my rig is adjacent to my computer.. Are you getting the picture?? Maybe the solution??

Well --

I just reached over and turned OFF the computer speaker!! No more hum!!

Ahhh, such are the "senior moments" in one's life!!

73 to all. See you on CW one of these days.

Dennis K6KRV

Well, glad you found it Dennis. But, you need to UNPLUG the speaker. Even if it is turned off, RF is still getting into the computer. 73

10620. TS-850 AT Help

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-09-07 00:07:31 UTC
From: steelgtr_95127
Topic: 10620 Message: 10620

I recently fired up the old 850 after a year or 2, connected to a simple dipole on the roof.

I thought the AT was working; I put it on auto, push AT tune and I would hear it do it's thing and watch the SWR drop to 1. Now the SWR stays pegged @ infinity.

If I leave it on AUTO and change bands, the amber AT Tune lights briefly, i hear the motor and the light goes out.

What could be going on?

thx

bob

10621. Re: TS450S no TX

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-09-06 23:59:46 UTC
From: fcp_lopes
Topic: 10438 Message: 10621

Hello after checking various topics related to this issue, I checked some items with no success in solving it.

Problem description:
The rig TS450S dont't transmit, gives a cw error code of "CHEC" when my AT-TUNE button is pressed. The atu won't activate and nothing happens when I depress my PTT.

Verifications:
with reset it does not go into transmit at all. Receive's on all modes all bands just like normal.

I have used a dummyload connected to the rig.

The red light don't come on and the rx don't mute when you push the send switch.

Menu item 19 is set to off.

I looked around and did not see burned componets.

Tested with hand mike, cw key, send button and no transmit.

I removed the Q54 from PCB for testing, could be short.

TXB=0v , RXB=7.7v , CSS=0v when push the send switch, still the same and no PTT.

would appreciate help please

thanks

ct1fac / Fernando

Hi Tony,

I don't have one but, "K1CRA_radio_store" sells such items on eBay. He has 8' x 12ga cords for $15 (+ $3 shipping). Search for #200647883938. If you want to roll your own, he has the plug w/ 4 pins by themselves (#200645506474) for $4.25 shipped.

You would use it to verify your output power into a known non-reactive reference load, what else.

There are 3 pins going through the board. You need to unsolder the old one to get it out.

Lots of guys replace the solder-in battery with a different holder and move it to a different place so you don't have to remove the board to change the battery. 73

That's what I did. Get battery holder at Radio Shack & relocated next to ant tuner. Wrapped holder in electrical tape. Be sure to check for corrosion as this is a common problem with the type of battery they used.

Yes hrd could work, there are many others as well. It depends on how you want to control it.

NO you can NOT control AF on screen, the manual does show you what can be controlled, (the supplement)

Also all kinds, kenwood has the if232c to use on all kenwood radio, and there are several aftermarket choices.....

A search on google or your favourite search engine should show lots of results...

I have been using HRD for over 5 years now with my 850 I find it to be the best rig control program available. I have used many others even some I had to pay money for and HRD wins hands down every time. No you can not control the AF levels but you can slect filters, modes and even slope tuning. There is a learning curve mostly for the logbook feature but it does not take long at all. And the best thing is HRD is FREE.
Have fun with it.

I use both HRD and PSDR with the LP Pan. I have to say I have fewer problems with HRD. PSDR locks up at times and I loose rig control.

From: kkyahoo
Topic: 10382 Message: 10645

Hi,

Can anyone tell me if there is a trimming adjustment on the SO-2 TCXO? There is nothing on the circuit diagram, I wonder if there is trimmer access under the stick-on label? Mine's aged a bit and is close to one end of the spec, so just wanted to tweak it back if possible?

That's whats under the label. Push down gently with your finger to locate the hole so you don't have to remove the entire label. They don't stick back too well...

Hi Oleg,

The only thing I can suggest is to watch for somebody parting out a rig on eBay.com, QTH.com classifieds, or some repair shop.

You have already checked at http://www.kenwoodparts.com?

Yes, my friends.
I tried to find it on kenwoodparts, partstore.com, pacparts.com and other sites, but - "R05-3462-05 This item is no longer available"
i was found this item on http://wirelessrepairsandbatteries.com/r05-3462-05-p602368.html but shipping only US and Canada.

Hi to all,

I just want to ask if anyone tried to repair the 850 lcd display? Iam working on a TS850 with damage LCD after the capacitor leak, it damages the inverter ciruit and other parts under the capacitor due to years in storage only.

I repair the inverter and other parts but now viewing the LCD requires an angle point or view angle. The only parts visible with direct view is the S-meter side, does anyone tried to do some repair in the Glass LCD itself? i was thinking the plastic film on top of the glass may cause it. Any possible repair technique with the glass LCD?

I know a complete assy on ebay is some times available but i want to try repairing it, ebay is last option.

Thank you
Alex

Your post is on the board. We need more information. Have you connected a dummy load to the transmitter and keyed it? How long did you transmit without an antenna? I wouldn't think you would have ruined the finals if it was a momentary thing. Was it working before this happened?

Well I can't tell from here so lets.

#1 turn PWR knob fully counter clockwise

#2 turn CAR knob fully counter clockwise

#3 Push in the power button

#4 make sure VOX button is out (VOX not working)

#5 Make sure MODE is in SSB, USB or LSB

#6 Key the mike , it should light but no power out so you can't hurt anything.

If it lights all is OK to this point, next is what type of antenna and/or dummy load??

Do you have another mike to try???, what if you hit the send switch??? On the face (if it has one), as the 850 does.

If the rig display does not display going to tx then the rig is not going into transmit. Does this rig have menu option to disable tx on certain modes??? Might try different modes. As another post said if rig has manual front panel tx sw try it. Might be bad mike. Connect rig to antenna or dummy load when trying this...do not key rig in any mode unless connected to good load.

Check for damaged traces on the circuit board like the thru-hole plateing the leaking cap cant damage and destroy these. As for the other question the battery is best viewed from the top but to get to it for replacement it for both covers to be removed and face plate tilted down.

Hi Roland

Thank you for the answer, currently the display of the 850 is working only it can not be viewed directly you need to find a good view angle in able to see the content of the display. The board was already repaired for cut and shorts. Now my issue is the view angle of the glass lcd it self. I was hoping if some one have some repair or restoring technicque with the glass lcd not on the pcb board.

Thank you & 73

Alex

It sounds like the display itself is working correctly but the florescent tube that is used for lighting is not working. You should have around 300v going to the tube itself generated by the inverter. The inverter power line is one of the affected by the leaking cap(s). 1/2 wave fan dipole, 20,40,10 total length 66 feet vs. 2 wire dipole, same length.

ANy advantages or disadvantages to the fan (multi-tap) type as far as tuning, swr, etc?

thx

bob

You'll probably find the dipoles need to be a little shorter than if they were driven individually....

Good luck...73, Jordan VE6ZT

Check out the dx-ee by alpha delta, a commercial example of a fan dipole for 40 through 10 (or the dxcc, which has a shortened 80 meter add on

I use the dxcc here, and find 1 dipole one feed much less space needed for dipoles!!!!

Here is a picture of a fan dipole I built.
http://i1102.photobucket.com/albums/g453/KD0ZZ/DSC00947.jpg

The 75M part can be cut by the book, the higher frequency sections should be a little longer and the trimmed for SWR in place. The difference will depend on the height from ground and the distance between each wire. If you spread them out it is more difficult to build but less interaction, spaced close like mine there will be more capacitance to the next wire so more difference. Start with the longest and then go higher in frequency. I had mine for 5 bands , 6 if you want to count 15M on the 40 wire.

I have a receive only question:

Would a fan dipole make any difference on receive only? IOW, right now I have a standard 65' dipole on the roof. Would adding a 33' tap improve reception on 20 meters or only when transmitting.

10688. Expand Xmit to 300-3.3 KHz to support MIL STD M110A mode

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-10-02 20:22:57 UTC
From: ltw_1937
Topic: 10688 Message: 10688

I am a MARS member and we are starting to try to use a sound card based MIL STD M110A mode. It requires a transmitted bandwidth of .3 to 3.3 KHz. I have both TS-450 and TS-850 with 2.4 and 2.7 SSB filters respectfully in both 8.3 and .455 IF's. I feel sure there is enough smarts in this group to lead me to a solution of my problem of expanding the xmit audio from it current audio range of ~.3 to ~ 2.8 KHz. I have had good (not Great) success with the receive part by IF shift expanding the upper part of the audio range but do not know enough about the xmit filter to even start searching for the right item. Any insight would be appreciated on this. Also any leads on selecting the 6KHz filter in the SSB receive mode would help. The real cutoff I am seeking is 3.3 KHz but would like to try 6 KHz if that is not available. Many Thanks and 73, Larry K4LLQ/ AAT3PY

The same day I get a 10 meter dipole installed, talk legally for the first time (technician) I'm trimming the antenna to dial it in; hit the send button in CW mode to check swr, the display flickers I hear a click and all goes dead.

A few minutes later I go to power up and it comes on. Check SWR on 20 and 40 just fine. Go back to 10 meters try to tune goes dead and now it stays dead.

Fuse tests fine with a DVM.

Any ideas

bob

Alberto, Thank you for the reply. All I found under "ts-850 hi-fi ssb"required the Kenwood DSP-100! I don't have one and the ones I have found cost two times what I paid for the TS-850 originally. I think I will keep looking but thank you, Larry K4LLQ/AAT3PY

Sounds like a bad power supply (voltage dropping under load) I would check that and the power connector, for bad parts , loose connection, etc.

Then look at the rig

The fact that it comes on without changing anything in the radio makes me suspect the above...

Bob ,
Also , check the SWR of any frequency you using not look at a band your not working and figure the one you are is OK ,
How are you tuning for 10m ?
Why are you checking SWR on bands you are not working ?
At least in your post , the way you describe your issue , does not make sense .
It would be common to have low SWR on one band and high on another , high SWR could stress a weak component in the rig .
Has anyone gone through the rig and checked for many of the counterfeit caps that can leak and create any number of issues like this , bringing a weak part failure a little early ?

Found it!

Took off the fuse holders on the DC supply lines and cleaned them with a small blade screwdriver (they went from dull to shiny) reassembled and all seems well!

thx!

I seem to be hearing AM broadcast signals on 160, 80, and higher bands. They are mixed in with normal signals in 10 Khz steps on RX. Kinda sounds the same as the CB intruders on on 10 meters with heterodyne with watery audio. Didn't find anything on this doing search on group.

Any ideas?
Mike

Hi Mike

Wonder what kind of antenna you are using.

This can happen with a bad connection somewhere--coax, or other connection. If there is any resistance from some kind of crud, it can act like a diode and rectify the AM signals. I've had that happen here.

Does it do it on 2 or more different antennas? 73
Tom W7WHY

I seem to be hearing AM broadcast signals on 160, 80, and higher bands. They are mixed in with normal signals in 10 Khz steps on RX. Kinda sounds the same as the CB intruders on on 10 meters with heterodyne with watery audio. Didn't find anything on this doing search on group.

Any ideas?
Mike

Have you bypassed the AM broadcast band attenuator? If so take out the jumper.

If not check D4 and D5 on the RF Unit for leakage.

Clif

The antenna is a 130' longwire with elevated radials. Use mostly on 160 meters. The nearest AM are 25 miles away with nothing over a 1 KW day and around 120 watts night. Attenuator working on 500 Khz to 1705Khz. I will need to D4 and D5 per Clif's suggestions.
Not happening now at 3:30 PM here now, but usually in evenings on many bands.

Follow Clif advise on the diode, i repaired same problem as advise also by Clif on a TS850 hearing AM Broadcast band, especially if you are near the transmitting station. It a RLS135 on the RF board, check all diode of the same type on the RF board.

Good luck

Hi to all. I'm new to the group with an ailing TS-450 with a RCV problem. The rcvr cuts in and out very frequently so as to render it unusable. Xmit works OK. I found a definite cold solder joint on the short wire on the switch board which connects the board input/output to the ant output SO-239 receptacle, as explained in one of the emails from this group, item #9934 by Alex. The wire was in fact loose in it's solder joint. I thought I had it nailed down. But now don't know where to go from here. Any help would be greatly appreciated, and thanks in advance.

Are you talking about actual signal cutting in and out or the audio only.
Could the squelch knob have been turned, rf gain turned down.

Could it be actually your antenna causing the trouble

Hi Jon

Does it do it on more than 1 antenna? If just 1 antenna, it might be a bad connection at the coax connector, or a bad jumper. that will sure do it.

Thanks to the guys who responded to my rcvr sensitivity problem. Operator controls are set correctly. Spkr/phones plug switch contacts appear ok. I gave them a quick shot of anti-oxidant spray. Ant (dipole) works ok with another xcvr. I went back to the previous cold solder joint, on the Switching board, at the ant input from the SO-239. This time I removed all the old solder and scratched the crud off the copper land on the cb so as to see clean copper. I installed a new piece of stranded wire from the SO-239 to the clean land of the cb and it appears to work ok now. Hypothetical question: what if the problem is with one of the sealed switches on the Switch board? Are new/used boards available anywhere? It doesn't look like any of the sealed switches/relays, are replaceable. Does one simply send the radio out somewhere to get it repaire? Or is it time to get another xcvr? The TS-450 has been a super reliable radio for
21 years.
Thanks,
Jon/W4HWM

10707. RCVR SENSITIVITY PROBLEM

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-10-13 19:29:00 UTC
From: Jon Wollerman
Topic: 10707 Message: 10707

My thanks to all who responded to my ts-450 sensitivity/cutting out problem. I thought I had fixed the problem by fixing a cold solder joint at ant input to the circuit board from the SO-239 center terminal. That was only part of the problem. As some of you out there suggested, I checked the solder terminals out on the antenna and sure enough, a wire connecting the balun to the ladderline had another bad solder connection. Last year when I installed a ladderline support, I noticed both of the wires were not bright copper colored, but much darker. The solder did not stick very good and in the FL corrosive humidity/weather, the joint failed. I will get some new ladderline plus install new leads on the balun and that should fix the problem for good.
Thanks again for the good help and advice.

10709. Re: RCVR SENSITIVITY PROBLEM - soldering corroded wires.

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-10-17 03:08:07 UTC
From: w8nf
Topic: 10707 Message: 10709

I have used muriatic acid. This is used as a concrete cleaner on poolsides. An auto mechanic recommended it for badly corroded battery cables. The auto battery cable in question was a braided mix of many copper strands, and had green growth on it from corrosion. Per his suggestion, I cut off the connector, dipped the still-filthy end in the muriatic acid and removed in just seconds. The copper does not come out shiny, because nothing was done to polish it. However, every last remnant of corrosion was gone and the "dull" but obviously copper color, was caused by the micro-pitting from the former corrosion. The new connector was intended to be soldered, and this wire took up solder like it was made of flux.

Careful, though...this stuff is strong, and should be used only outdoors.

I have checked all the obvious. All bands are the same, I did try API, the attenuator switches are in the proper position. This morning when I checked the radio it was working, after about an hour it went dead again. Must be a temp problem. With the audio control turned up all the way I can just barely hear the audio and it was distorted. Harvey

If it's still working on AM cross your fingers and check the Car board for leaking caps and hope you find some. If there are no leaking caps it could be a DDS IC. Look at the IC's are they 6631 or 66312?

10714. Another very happy AVVID rescued TS-450S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-10-18 13:57:38 UTC
From: William C. Johnson
Topic: 10714 Message: 10714

Finally got the TS-450S fired up to see how it was working after a visit to AVVID.

It left dead and returned very much alive. Nice radio, I bought it and 5 minutes after turning it on it died.

I messed with it and had no luck. Contacted AVVID and Clif tried to keep me from sending it to him.

He spent two or three days coaching me on things to try before he finally gave in to my whimpering and let me send it to him.

I was first licensed in Ham Radio in 1960 working with Clif reminded me of all the Elmer's I have had over the years.

Clif was not overly cuddly but he was every bit the tutor and technician no BS just results.

Dealing with Clif was every bit the best service experience I have had in these times.

He even told me what he found, Wow that was refreshing.

Clif,
No leaking capacitors, and the DDS's are 6631. How do I tell if one of these chips is bad? Any other suggestions
Harvey

If it's still working on AM cross your fingers and check the Car board for leaking caps and hope you find some. If there are no leaking caps it could be a DDS IC. Look at the IC's are they 6631 or 66312?

You need a frequency counter to find out for sure.

Set the radio to 14.200 USB and measure the following;
LO-1 4.748390 mHZ IC1
LO-3 8.375139 mHZ IC2
Car 456478 kHZ IC4 Most likely.

all are plus/minus 1-200 hz depending on reference oscillator.

If one of them goes bad the frequency will be way off if it exists.

10717. TS-850S receiver overload

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-10-19 20:09:01 UTC
From: pa3ezl
Topic: 10717 Message: 10717

Hello,

After some years of having kept my TS850S in a box I recently fired it up. I noticed the receiver would overload with all sorts of "image" signals (AM broadcast but also HAM RADIO CW). This condition goes virtually away after selecting 12-18dB of attenuation, sometimes (at night) I need AIP as well. The higher the frequency band the less attenuation I need to remove the "images". I can't tell what the exact location (freq) of the image sources is, most likely below 20meters.

Any ideas what might be wrong?

Clif,
I just measured the frequencies and here is what I got:
LO-1 4.748594MHz
LO-3 8.375055MHz
CAR 456.426 KHz
But now it is working, I think I have an intermittent problem or a temp problem. It did this a few days ago after I let it set overnight it came back on, but the next day it was dead.
You replaced C1 on the CAR board and D31 on the RF board about 2 years ago.
what do you think?
Harvey

Now you need for it to quit so you can check them again. If it's a DDS IC I've never had any luck with heat or freeze affecting them. They quit when they want to.

10721. Re: TS850 LCD problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-10-21 04:09:38 UTC
From: Ramon DU1FV
Topic: 10654 Message: 10721

Hello everyone! I have here on the workbench an old ts-850.It also suffers from this "difficult to find" viewing angle problem. We have another ts-850 at the club and its display is a lot better. I took a look at the display board and found C18 has already been replaced and some work has been done on the traces.C18 was replaced with a 470u 16v unit. The LCD panel looked like the top layer of plastic has a slightly crinkled surface as if subjected to overheating or bad chemical cleaner. The display back light works but seems a tad "yellowish"

My questions are:
1. Does the fluorescent lamp really turns yellowish with age?

2. I tried measuring the voltage across the cfl tube but could not get much. I hear a soft screeching sound when i touch the voltmeter probe onto it though, as if arcing is present somehwere

3. Is it possible that the top plastic layer is a plastic polarized sheet and the crinkling has distorted it rendering it ineffecient?

4. Has anyone with this display problem tried looking at the display through a pair of POLARIZED SUNGLASSES or polarized plastic sheet?

5. Is it possible that the lcd is "worn out"as a result from uv from the backlight? I read in the internet somewhere that lcd projector turns yellow with age because of LCD degradation with uv.

I am excited about number 4 above, I am praying a piece of polarized sheet on top of the lcd might help but i have no polarized lenses around to test. Maybe you might have your fly fishing glasses handy!

Thanks for reading this long post!

The board was already repaired for cut and shorts. Now my issue is the view angle of the glass lcd it self. I was hoping if some one have some repair or restoring technicque with the glass lcd not on the pcb board.

Today my radio has a new issue. After being in storage for a year i put it back in service. It had low volume and i changed the leaky capacitor. The radio worked good for about a month. Now this morning i powered up the radio and the S meter is full scale. This would be similar to rotating the RF gain ccw. Of course i have no receive but i can briefly hear rx if i go from tx to rx. One time i changed bands and the rx came back but the s meter slowly went to full scale and no rx. Ok thank you in advance

Hi there

The audio output cap has the agc line running right alongside or underneath it. What has happened is that the liquid from the output cap has leaked onto the tracks. Because it is corrosive and conductive, you need to clean the board around in the area of the audio cap thoroughly and check that none of the tracks or thru-holes are corroded. I used lacquer thinners on an small stiff artist brush to clean around this area - careful, this stuff softens certain plastics.
Good luck - its a common fault on these rigs.

AGC problem, same with my TS690 when i experience leaking audio capacitor. Clean the near by area where you replace the capacitor, usually you must remove the murata filters (black cube plastic) clean under it with a cleaner, i use ethyl alcohol to remove the acid leaked from the capcitor, you need to clean the area very well to remove or clean the acid. When fully dried, you can hot air blow the cleaned area on the PCB. The acid shorts the AGC line to ground making the meter moves to full scale and down when the radio warms up.

Good luck & 73
Alex

Hello all,

I have the same issue with my TS-450SAT...I will try that and see what happens

Anymore hints would be greatly appreciated.

10728. ts-450 tuner modified for use with TS-850?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-10-24 09:30:07 UTC
From: Ramon DU1FV
Topic: 10728 Message: 10728

Hello!
Has anybody ever modified a ts-450 internal tuner for use with the ts-850s? I took a look at both radios at schematics and found similary labeled terminals but at different positions in the connectors. I have a junked 450 tuner that i could restore. At the very least, I could mount in a box with push buttons for controlling band, etc and use it as an external tuner. hihi. something to do when i get bored.
Tnx for reading.

Does anyone have any documentation on the DDS chips ??

I have this silly notion that it might be possible to reverse engineer the function of the CAR board using some of the modern DDS chips...

A complete definition of the inputs and outputs of the CAR board would be a simpler approach.

Probably tilting at windmills, but who knows...

Villy ,
Just wanted to link to this question , just in case there is some info
on alternatives .
I do not need any at this time , but who knows what I'l find to fix later :)

Good luck, AFAIK they were custom made for Kenwood by some chip mfg. I have never been able to find anything on the web.

If you need the analog levels and freq of each chip that I have. As far as the data????

10732. TS-850 communication issue with SteppIR SDA-100 controller

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-10-24 20:28:05 UTC
From: jlberry
Topic: 10732 Message: 10732

Does anyone use the SDA-100 with Kenwood TS-850S? I need help.

I have a new DB-18 with SDA-100. All is working well except for communication between the SDA-100 and my Kenwood TS-850S.
I have worked with SteppIR and verified the S-15 cable (6pin CAT to RS-232) is good.
The controller is set up for Kenwoood, 4800 baud, etc. It talks to the antenna just fine, just deaf to the radio.

The only mod to the radio was to open it up for MARS operation (clipped a diode I think, years ago) and the addition of two 500hz CW filters.

Appreciate any help or suggestions!

Jack

It is not a silly notion at all. I think it is just a matter of time before someone comes up with with a CAR board using availabe chips. It does take time to study the requirements and modify the design using available materials. Hams do this all the time. hihi.

Topic: 10729 Message: 10734

Doesn't surprise me....

Hopefully it'll never be an issue for me - since I do have the xxxx2 chips in my Ts-850sat.

I've been looking at the diagram & reading the documentation - as thin as it is, and thinking that it shouldn't be that hard to do.

Using a 100 mhz capable DDS chip - that generates a sine wave should allow one to get rid of a fair bit of circuitry to begin with - e.g. the MCAR signal with it's ladder networks, choppers, ceramic filters etc.

I'm retiring in about 18 months - sounds like a good retirement project - if I can find a Ts-850 with a dud CAR board. (also give me an excuse to buy a scope, freq counter etc... although probably a lot cheaper to build the freq counter. Then a Data Capture Device of some kind....

One thing is apparent - dropping FM might simplify things a lot.

Well it would be an interesting challenge. It would little experimentation to discover the protocol between the cpu & the DDS chips. The safe approach would be to replace each of the DDS chips with a microprocessor & a modern DDS chip - although it should be possible to just use a single microcomputer to control all of the new DDS chips. I suspect that the reason for the present board using harmonic components was that they couldn't run the 6361s fast enough to generate the frequencies directly. Definitely not a problem with modern chips - which should simplify the boards quite a bit. The only gotcha that I see is the FM function that the existing chips support. It might not be an issue -

Something to give some more thought to. I wonder how many Kenwood's with bad CAR boards exist..??

Nothing hard at all about building a board using state of the art DDS chips. It's getting the radio to talk to it so that it outputs the needed frequencies. There-in lies the rub.

Yes indeed - therein lies the rub.

I think that I managed to get enough information out of a couple of the service manuals to at least make a start. If I find a really cheap TS-850 (with a shot CAR board) I might give it a try. Much of it seems straight forward, but there is something a little interesting in how CAR2 can load it's divisor from CAR1. If one would run into problems, it might be with how the FM is generated.

It makes sense to generate the rf at the required frequency - getting rid of the filters and multipliers on the CAR board. Needs thought

I had the same problem.

1) - have you bought or built an IF converter (take the logic levels from the radio to RS232 levels plus & minus 5 volts works)
2) (my problem) have you got the jumper in the rs232 connector that connects to the SDA100 ??? (in addition to the data pin & ground coming from the computer or the radio)

Thanks for the response. You're obviously a lot more informed that me.
1) - not sure how to answer except to tell you what I have. I have only the S-15 cable purchased from SteppIR.
2) - in the RS-232 (S-15) connector housing, two sets of pine pins are jumpered. They are 3-4 and 7-9. Nothing jumpered on the six pin end of the cable is that's what you meant by: (in addition to the data pin & ground coming from the computer or the radio)

seems to me that you guys are on the right track . losing FM would
never be a problem for 850 or 950 users. if you got t have FM get a
cheap radio for that mode. i think there would be a good market for
the boards. kenwood sold a few boxcar loads of those radios. as far
as a scope goes i have a couple in the shop. will send you one when
your ready to get started.

Sending me a scope could be expensive ! After further study of the manual and schematics, I think that what I need to do is to build a data analyser. I remember trying to get my boss to buy me one back in 1973. They wanted something like $10,000 for a ten channel 1kbit/channel data scope.. (didn't happen). Can probably whip up what I would need out of a couple of micro-computers. Now is someone had a ts850 with a dead car board that they would be willing to donate.....

Probably more of a job than I should be taking on before retirement (abt 18 months off). The more I look at it, the less of it a problem it appears to be (hopelessly optomistic!)

Villy ve6sq

Could probably do the same today with a

Villy ,
Funny how we are always on the lookout for good working , trouble fee gear , now try to find a dead one , whats up with that :)
I bought mine from an estate , hadn't been used for 1 yr. + , had issues right off , replace caps on CAR board , then display acted up , a couple more caps , now an alignment ? / what ever , a little off frequency , but other wise works good .
On mine the chips were still good , so not a good candidate , but I'll keep an eye out and let you know .

Fm is done on the PLL board by modulating the Het osc to generate FM
and as long as the common data stream is not changed it will be fine. You have to figure out the data stream to the DDS chips and how to use it. IC3 on the Car unit is for the monitor circuit.

OK on that.. although it appears that one of the CARs is used to generate sub audible tones for FM.

The thoughts that I currently have are to:
1) Run the 20mhz feed to the CAR board through a couple of frequency doublers to take it up to 80 mhz. At the same time, this will turn the signal into a square wave - not a problem.

In place of the existing DDS use Analogue Devices DDS chips.
They will take the 80 mhz clock quite nicely and directly generate the required frequencies (nice sine waves) (obviating the need for the frequency multiplication & filtering that currently takes place.

Will likely need some micro support to convert the existing data stream into what is required for the AD chips. Might need a micro for each of the DDS - probably the safe approach.

One DDS might be able to do the work of the bottom 2 CAR chips on the diagram - I need to think some more on that one.

would be neat if it could be made to work.

10746. ts450s wiring headset with boom mic

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-10-26 03:05:51 UTC
From: thairadio99
Topic: 10746 Message: 10746

I ordered a headset with a boom mic of ebay....It is a audio comm pro. It comes with a adapter that converts the ts450s mic to accept the pink and green computer style conectors....The adapter is wired as follows...

red/white pin 1
braid pin 7
resistor pin 1 to pin 5 value = 23k

Here is the problem detailed

1. test vox with factory mic 100% working
2. plug in pro headphone jack ... headphones working 100%
3. plug in adapter with pro mic
4. speak in to pro boom mic the radio key vox active working 100%
5. Stop speaking radio stays keyed!!!!. Turn mic gain down to 0 radio stays keyed.
6. Disconnect pink connector (mic) from adapter radio stays keyed
7. Remove adapter radio unkeys

thank you in advance

Pin 5 appears to be 8VDC. Perhaps the headset uses an electret condensor mic element and needs V+ to function. You would think that the audio would be decoupled inside the rig at some point with a capacitor so that the voltage applied from the resistor wouldn't keep it keyed. Perhaps add a cap at the audio input pin?

10748. Re: YM66312 DDS Chips replacement (450s, 690s, 850s)

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-10-26 16:53:29 UTC
From: vojtech
Topic: 10729 Message: 10748

Hello all,
I had to solve the damned YM6631 problem in my TS450S buying as I was said some of the last available pieces on the web paying dearness for it.
It seems that 450s and 690s?? were assembled only with the DDS 6631s too, but the frequency of failures on the web seems to be much lower than those on TS850s based on the web, but mine failed too.
I think it needs to have more users with dead DDS and due to that absolutely unusable radio up to the moment, that somebody will take care about the YM66312 replacement and maybe let him paid for the time he spent on it, in case he do it really well. It sure needs some time and logic analyzer work to find the data from the communication, what are sent from the TS processor to the DDS and prepare a circuit, which will react to commands in the same way.
More or less the best solution (if it is universal for all TS-450, 690,850) is to have it pin compatible or maybe some small PCB module which will be directly soldered to the PCB in place of dead DDS. As the service manual for 450 shows, the 6631 is a "stupid" digital circuit without analogue part (the D/A conversion is done on the resistor network) so its replacement by some programmable modern array like Lattice, Altera or similar should be not so complicated.
The way to use the Analog Devices DDS is nice, but this leads to whole PCB replacement for CAR unit for TS-850, but in such case the TS-450s (690s) will need another board, because the PCB has only 2pcs and different construction.

But the number of hopeless owners of the TS-850 scrap is still too small and that the number of beloved users of those radio is still decreasing, not even due to the DDS, but leaked caps and other altering problems of old electronics.
I paid (due to my love to the radio) the price of the IC which was about 30% of value of other TS-450s on the ebay...
So we will see, if this work will be interesting for somebody..

Thanks for reading,
ok1vaw, Vojtech.

I saw a post awhile back that said this company might have them.

East Coast Transistor
2 Marlborough Road
West Hempstead, NY 11552
(516) 483-5742

This is a KW parts distributor. I don't see a web site.

Nothing hard at all about building a board using state of the art DDS chips. It's getting the radio to talk to it so that it outputs the needed frequencies. There-in lies the rub.

What is considered a "late" model 850, and what years of production were the late models built? Serial numbers?
I bought my 850 from a friend who bought it new in the summer of 1993. I was wondering if I had a late model???
This radio has only been opened up to install filters. It works perfectly. If I don't use the radio for several days or weeks then the display will not come on for maybe 10 or 15 seconds. If it's used everyday, then the display comes on right away.
Clif if you're reading this, I hope to send it to you sometime this winter for some general maintenance.

The DDS chips are not an eprom. They do have a lot of ROM in to generate a sine wave, but there is a lot of additional logic besides...

You have a good point about perhaps being able to use a programmable array of some sort to replace the DDS chips. Trying to come up with something that will fit the 6631 footprint etc might be more of an issue...

A capacitor between the mic input and gnd? What value would you recommend?

>
> Pin 5 appears to be 8VDC. Perhaps the headset uses an electret condensor mic element and needs V+ to function. You would think that the audio would be decoupled inside the rig at some point with a capacitor so that the voltage applied from the resistor wouldn't keep it keyed. Perhaps add a cap at the audio input pin?

Didn't worry about the clock. Only about using the existing data stream to talk to whatever chips are to be used. While at it realize that each 66312 is a dual oscillator.

No, a DC blocking capacitor between the resistor/mic and the pin on the radio mic input connector like this (I hope this turns out ok)

```
input--||--------mic element
|
\
/ 23K Ohm
\
|
8VDC------'
```

get a small 1 uf and see if audio will pass through that.

10761. Re: YM66312 DDS Chips

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-10-27 02:45:19 UTC
From: villy.madsen
Topic: 10729 Message: 10761

We would need a clock to feed the new DDS chips - 80 MHZ , so doubling the existing 20 mhz twice would give us that - without changing the calibration any. The 20 mhz could also be squared up and used for clocking the micro-controller, although using a separate crystal might be wiser

As I understood it, the 66312's have got dual frequency & phase registers - but only one of each can be used at any given instant. (of course you can flip back and forth - for FSK as an example).

The chips that I was looking at also have dual freq & phase registers - and can also be toggled back and forth between the two - although switching between the 2 freq registers can (I believe) cause a glitch. I need to read more about it - I know that there is a way to switch freqs without it glitching.

I think that the whole thing could be done with a single micro running at 20 mhz.

Any thoughts on the idea of generating all of the required frequencies at the required frequency and doing away with the multipliers and filters ?? That would mean that all that would be required would be some pads or amps to bring the signal levels in line..

Villy

Tom sorry as i can be tech challenged. The cap is between mic element and input? If this is correct when disconnecting the mic element from the input should also unkey the radio?

To unkey the radio I have to remove the adapter with the resistor in to unkey the radio...

The idea is to block the 8 volts coming through the 23k resistor going into the audio in with a cap. It really doesn't get any simpler than that.

10766. [TS-850_450_690] 850 serial numbers

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-10-27 12:52:23 UTC
From: Bob Naylor
Topic: 10752 Message: 10766

Forgot to mention that I have read about serial numbers over 5 (first digit) are OK which is what mine is. Is this correct?
Thanks, Bob WE6C

What is considered a "late" model 850, and what years of production were the late models built? Serial numbers?

I bought my 850 from a friend who bought it new in the summer of 1993. I was wondering if I had a late model???

This radio has only been opened up to install filters. It works perfectly. If I don't use the radio for several days or weeks then the display will not come on for maybe 10 or 15 seconds. If it's used everyday, then the display comes on right away.

Clif if you're reading this, I hope to send it to you sometime this winter for some general maintenance.

Bob WE6C

My TS-850 N ° 31000424 1993 bought in Italy, if it can serve as construction year 92-1993 suppose, has had several repair works over the years but it is the only radio I have, and they are in love, which delays the display to 'I can not advise you start well, and required inspections by qualified technical assistance, may' be some loss in the condenser of the logical drive or display, but I can recommend the change I made on the battery of written submissions, are on the site mods.dk I strictly used the parts listed so that they are accurate editing, a 3.5-volt battery and battery holder

Subject: [TS-850_450_690] 850 serial numbers

Forgot to mention that I have read about serial numbers over 5 (first digit) are OK which is what mine is. Is this correct?
Thanks, Bob WE6C

What is considered a "late" model 850, and what years of production were the late models built? Serial numbers?

I bought my 850 from a friend who bought it new in the summer of 1993. I was wondering if I had a late model???

This radio has only been opened up to install filters. It works perfectly. If I don't use the radio for several days or weeks then the display will not come on for maybe 10 or 15 seconds. If it's used everyday, then the display comes on right away.

Clif if you're reading this, I hope to send it to you sometime this winter for some general maintenance.

Bob WE6C

Is the audio clipped ?? i.e. does it sound like the carrier is centered on the filter rather than offset abover or below??

I would think that you would then notice a distinct lack of highs on what you are hearing & do the others hear the same lack of high frequencies on your transmission ???

Subject: [TS-850_450_690] Re: YM66312 DDS Chips

We would need a clock to feed the new DDS chips - 80 MHZ , so doubling the xisting 20 mhz twice would give us that - without changing the calibration any. he 20 mhz could also be squared up and used for clocking the micro-controller, lthough using a separate crystal might be wiser
As I understood it, the 66312's have got dual frequency & phase registers - but nly one of each can be used at any given instant. (of course you can flip back nd forth - for FSK as an example).
The chips that I was looking at also have dual freq & phase registers - and can lso be toggled back and forth between the two - although switching between the freq registers can (I believe) cause a glitch. I need to read more about it - know that there is a way to switch freqs without it glitching.
I think that the whole thing could be done with a single micro running at 20 hz.
Any thoughts on the idea of generating all of the required frequencies at the equired frequency and doing away with the multipliers and filters ?? That ould mean that all that would be required would be some pads or amps to bring he signal levels in line..
Villy

Hello Gentlemen;

Does the chronological order
would be the one below?

0xxxxxxx - 1990
1xxxxxxx - 1991
2xxxxxxx - 1992
3xxxxxxx -
1993
4xxxxxxx - 1994
5xxxxxxx - 1995
6xxxxxxx - 1996
7xxxxxxx -
1997

Does anyone know?

Humberto;

From: avvidclif
Topic: 10752 Message: 10776

Here is the chart that Laurie over in the TS2000 group put together and it's accurate. Except the 850 didn't last that long. It is written for the 2000 but applies to all of them. It helps if you know appx when the radio was made. The 850's started in 1991.

Kenwood serial numbers issued during the production life of the TS2000 come in 2 formats.

The original format used from the initial production up until approx August 2008 is as follows:
All numeric - First digit is Year code, add 1998 to get year. If first digit is 0 add 10 to 1998.
Next 2 digits are month code starting with April (beginning of Japanese tax year) as 01.
Months 10,11 & 12 will be Jan, Feb March of the next year so add 1 to the year.

Examples:
301xxxxx = April 2001
311xxxxx = February 2002
909xxxxx = December 2007
910xxxxx = January 2008
001xxxxx = April 2008
005xxxxx = August 2008

The second format adopted from approx August 2008 is alpha numeric.
The first 2 characters are the year the 3rd is the month starting with 1 in January.
A8 = 2008
A9 = 2009
B0 = 2010
B1 = 2011 and I believe B2 will be 2012 (time will tell if I am correct)
The month runs from 1 Jan to C Dec.

Examples:
A88xxxx = August 2008
A8Bxxxx = November 2008
A91xxxx = January 2009
A9Cxxxx = December 2009
B02xxxx = February 2010

Clif, Kenwood never saying anything about it is interesting. You're right, I guess I'll have to pull it apart and figure it out.Someone else said that maybe serial numbers in the 5xxxx was built in 95. I thought mine was earlier than that however my memory beyond 10 years is very shaky.Bob WE6C

The TS
870 follows the following chronology:

1995 = 70
million
1996 = 80 million
1997 = 90 million
1998 = 00 million
1999 =
10 million
2000 = 20 million
2001 = 30 million
2002 = 40
million
2003 = 50 million
2004 = 60 million

Here is the chart that Laurie over in the TS2000 group put together and it's accurate. Except the 850 didn't last that long. It is written for the 2000 but applies to all of them. It helps if you know appx when the radio was made. The 850's started in 1991.

Kenwood serial numbers issued during the production life of the TS2000 come in 2 formats.

The original format used from the initial production up until approx August 2008 is as follows:

All numeric - First digit is Year code, add 1998 to get year. If first digit is 0 add 10 to 1998.

Next 2 digits are month code starting with April (beginning of Japanese tax year) as 01.

Months 10,11 & 12 will be Jan, Feb March of the next year so add 1 to the year.

Examples:

301xxxxx = April 2001

311xxxxx = February 2002

909xxxxx = December 2007

910xxxxx = January 2008

001xxxxx = April 2008

005xxxxx = August 2008

The second format adopted from approx August 2008 is alpha numeric.

The first 2 characters are the year the 3rd is the month starting with 1 in January.

A8 = 2008

A9 = 2009

B0 = 2010

B1 = 2011 and I believe B2 will be 2012 (time will tell if I am correct)

The month runs from 1 Jan to C Dec.

Examples:

A88xxxx = August 2008

A8Bxxxx = November 2008

A91xxxx = January 2009

A9Cxxxx = December 2009

B02xxxx = February 2010

It is interesting....

The TS450 & 690 implement a simplified version of the Frequency Generation scheme used in the 850..

the 950 is completely different.......

From: Ramon DU1FV
Topic: 10654 Message: 10782

i came across this article that might help explain the degraded lcd performance:

In order to reappear the color natural light and light from back light, such polarizer are required that have flat transmittance in all visible area.
As the old polarizer absorbs the light more in short wavelength area, it causes the whiet display to yellowish. Inorder to improve this phenomenon, trying to increase the ransmittance at short wavelength area, black display at cross condition will be bluish and contrast ratio will be decreased.
This polarizer has such preformance as paper-white at white display, controlling yellowish at white display and bluish at black display.

From: dr7zyq
Topic: 10783 Message: 10783

I am selling my Kenwood TS-850Sat. This radio is in very, very excellent conditon, cosmetic and operational.

It does not include any accessory filters, but does include the voice enunciator module (VS-2), the digital recorder unit (DRU-2), and, of course, the auto antenna tuner.

The serial number is 7-------, and the carrier board caps are just fine.

Included, in addition to the modules mentioned above, are the original user manual, original service manual, hand mic and power cord.

$675.00 shipped within ConUS only.

Shipping will be double boxed and via FedEx, with signature required upon delivery. Payment only by USPS postal money order and I will only sell to a licensed ham. The delivery address must be your QRZ address.

Thanks,

David, WA7ZYQ

10784. Wanted TS-850S Key socket

Tony

from
http://www.radiomods.co.nz/kenwood/kenwoodts850.html

One of the minor draw backs to the TS-850 as a CW contest machine is the inability to use the internal keyer in conjunction with an external keying circuit such as a personal computer or auxiliary memory keyer. As designed you must manually throw a switch from internal to external keying to switch between one or the other. To make matters even more inconvenient this switch is on the back of the unit and is not readily accessible during normal operation.

Simply said this modification involves running a new keying line from the junction of S1 and D51 on the IF Board. For convenience this additional keying line can be wired to the DSP1 and/or DSP2 RCA phono jacks if you do not use the external DSP unit.

The modification to the unit to resolve this problem takes less than 30 minutes to accomplish and can be done without "permanently" modifying the unit which would detract from its future resale value. If you don't use the external DSP unit then the two RCA phono jacks marked DSP1 and DSP2 can be used as additional keying input jacks as will be outlined below. If you use the external DSP unit then the modification can still be accomplished by running the external keying line out on a "pigtail." I highly recommend the purchase of a service manual which will greatly improve your ability to indentify the circuit points involved in the modification.
Considering that the radio costs $1500 what's another $30 to keep from messing it up! By the way compared to the two TS-930's that I nursed through the 80's, this radio is a breeze to trouble shoot and repair which I have had to do twice through no fault of Kenwood (long stupid story ~8>).

From here you proceed at your own risk, if you fry the radio DON'T CALL ME. A precision low wattage solder pencil for doing surface mount soldering is recommended, If all you have is a 150 watt Weller solder gun then read no farther your better off taking the unit to an expert rather than "melt" the circuit traces.

I assume no risk for the accuracy or completeness of the enclosed information. All yee who enter here embrace all hope for you may likely have a better contest radio when you are done.

Turn the unit upside down with the back of the TS-850 toward you.

Remove the bottom cover.

In this position the IF board is on your left.

Remove all the screws holding the IF board to the chassis.
(put them in a jar or something for safe keeping).

Unplug enough of the cabling to allow you to tilt the board up so that you can access the bottom side of the board underneath S1 the "External/Internal" keying switch.

On the bottom side of the board directly underneath S1 you will see 6 solder pads arranged in two rows of three pads each.

The middle pad on S1 nearest the back of the radio should be GROUND, solder the braid of an approximately 9 inch piece of small audio style shielded cable to this point, being careful to dress the coax so as not to short to other circuitry.

The middle pad on S1 in the next row up of three pads is the keying line. Solder the center of the shielded cable to this point.

Route the other end of the shielded audio cable through the chassis in the vicinity of the DSP jacks above.

Carefully inspect all solder joints for shorts, etc. Replug the wire harnesses unplugged in step 5 above and reassemble the board to housing. Reassemble the bottom cover.

Turn the unit over and remove the top cover.

Find the DSP input board with the three RCA phono jacks on it at the rear of the unit. The two DSP jacks are on the right when facing the rear of the unit. There are two connectors on this board (a 2pin and a 4pin). Unplug the 4 pin connector. Obtain another 4 pin connector and connect as follows (or directly solder to the underside of the board as follows) If you only need one additional CW jack then ground is pin 2 (closer to center of the radio)connect the braid of your new key line to this pin. The input from the middle RCA phono plug is pin 1 connect the ceneter conductor to this pin. Like wise if you want two additional CW jacks then do as above plus add a short between pins 1 and 3. If you want a small RF choke or some ferrite beads on the center conductor of the audio cable may prevent keying problems in high RF field environments...

Close the unit up and switch S1 to INTERNAL keying. You should now be able to key the unit via the internal keyer (Via the standard key input jack) or with an external keyer or computer via the old DSP jacks, without having to switch S1.

10786. Of a TS850 sat, Filters VBT and other Stuff

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-10-31 15:15:23 UTC
From: villy.madsen
Topic: 10786 Message: 10786

As some may recall,
about a year ago I purchased a couple of the 2.1khz filters from InRad and installed them in the "500 hz" slots in my TS-850.

They worked great, except that the VBT did not work as expected in the CW mode. (SSB & RTTY mode, no problem.

Also the installed SSB filters worked fine with the VBT in CW mode (and the other modes).

After a lot of thought on the subject and some experimentation I am now postulating that the issue is the software in the rig. My thoughts are that the programmers reasoned that:

if someone is picking the 500hz postition:
1) in SSB mode, it must be because he has put some SSB with filters in it & there gave the VBT tuning a range of + 2.5 khz...
2) in CW mode, because he has 500 hz filters & so doesn't want as much VBT range as in 1).
3) in RTTY mode, hasn't got a clue & so provides a range wide enough to handle a voice filter in this position.

4) when the built-in 2.7 khz filters are selected, the VBT works as expected in all modes..

Some testing using a DSP product on the computer to display the rx audio out seems to support the above theory.

So, the question that i have is....

I am very happy with the 2.1 khz inrads for SSB use.

Is there any reason why I couldn't replace the provided 2.7khz filters (that are hardwired in) with the inrad 2.1 khz filters (after dismounting them of course) ???

There might be some loss of fidelity, but the 2.1 khz filters sound fine to me & most of my operations are contest anyway...

Now you need for it to quit so you can check them again. If it's a DDS IC I've never had any luck with heat or freeze affecting them. They quit when they want to.

10788. DDS chips

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-10-21 14:12:07 UTC
From: villy.madsen
Topic: 2986 Message: 10788

I'm lucky, my TS850sat has the new chips in it. I am wondering though if anyone has a copy of the detailed specs for the chips. It sounds crazy, but I wonder if it would not be possible to design a replacement for the CAR board.

The easiest would be if the outputs from the micro to the CAR board are completely documented. One would probably have to put a micro on the new board to do some "translation" - but maybe it's not quite as crazy an idea as it sounds...

From: Ramon DU1FV
Topic: 10654 Message: 10789

Hello!
FWIW i read this

"WHEN DOES THE POLARIZER FILM NEED TO BE REPLACED ?
The polarizer film covers the front as well as the back of the glass substrate. The polarizer film which covers the front of the glass substrate is the film that is seen by the user. Often, this polarizer film is scratched, damaged, torn or even melted by having spilled hot liquids over it. In all these cases, the front polarizer film needs to be replaced.

The polarizer film, which is on the back of the LCD glass substrate often shows melting sign because of prolonged higher temperatures on the inside of the LCD glass. In this case, the user will experience loss of contrast and color, an unclear image, etc. In this case, the back-side polarizer film needs to be replaced."

Subject: [TS-850_450_690] TS-850Sat for sale

I am selling my Kenwood TS-850Sat. This radio is in very, very excellent conditon, cosmetic and operational.

It does not include any accessory filters, but does include the voice enunciator module (VS-2), the digital recorder unit (DRU-2), and, of course, the auto antenna tuner.

The serial number is 7-------, and the carrier board caps are just fine.

Included, in addition to the modules mentioned above, are the original user manual, original service manual, hand mic and power cord.

$675.00 shipped within ConUS only.

Shipping will be double boxed and via FedEx, with signature required upon delivery. Payment only by USPS postal money order and I will only sell to a licensed ham. The delivery address must be your QRZ address.

Thanks,

David, WA7ZYQ

From: jlberry
Topic: 10792 Message: 10792

I am selling my Kenwood DSP-100. The unit is in very nice condition, both cosmetic and operationally.

Cables and real panel connectors are solid.

The serial number is 211######.
I have original box and copy of printed manual. Hi-res pictures available on request.

$575.00 shipped in continental US only. HI & AK added actual cost.

Shipping will be double boxed and via UPS. Pay by USPS money order, certified check or PayPal.

Did you look at the back of the battery? Tilt it over and look for white powder on the back. If the SN is over 4xxx it's probably ok, feeling lucky?

I don't know where your info comes from but the AGC line doesn't even go to the Car unit. That's the TXB line under C1.

Just replace C187 on the IF unit and see what happens.

10800. TS-450 Moving to TS-850 - What will I gain?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-11-06 05:13:29 UTC
From: k9zy
Topic: 10800 Message: 10800

Consider a TS-850SAT purchase, because I understand the slope tune is excellent for audio reception and removing noise. I use the TS-450SAT today with a JPS NIR-12 Noise and Interference reducer... and it works quite well at cutting the band noise I have in my area (S7 to S9 on 40, 80, and 20 meters usually). The 450 is stock, so no additional SSB filters. I can adjust the 8.83 to the 6K and 2.4K settings, and the 455 to the 12K 6K and 2.4K settings, but not 500 on either, so I'm assuming this is stock) I'm work only in SSB.

For you 850 users, what will I get by moving up?
And... I've got a 380XXXX serial number 850 rig I'm considering. I'm told it has teh newer DDS chips (5 digit). Will I see cap issues, and other problems I need to check for? If this is a problematic year, what serial number category do I look for?

Many thanks for the advice.

Mark
K9ZY
P.S. I'm considering the slightly older TS-940SAT as well, if you have thoughts on it versus the 850.

I have a TS-450S and an 850S. You are going to see more selectivity out of the 850. The slope tuning is helpful. I like both radios and have a full compliment of CW filters as well as one SSB filter in each of them. I have never owned a TS-940S but they reportedly suffer from excessive phase noise. I would read the ARRL review of the TS-850S. At the time it was written, they claimed it was the best HF radio they had tested to date. If I was buying a new radio and could afford it, I would grab a TS-590S. I have one and it is superior to both the 450 and 850. I am primarily a CW op.

First of all if they are the newer DDS chips you should be fine. The caps on the CAR board should be checked out and the memory Battery needs to checked out also. As for the Slope tuning it does help with noise but not a lot but the NIR-12 will be a very useful addition. Now as for filters I recomend a upgrade to Inrad 2.1Khz filters in both IF's (455 & 8.83) if you do SSB. Also an addition of a 400Hz filter for the 8.83 IF is great for Digital modes. And if you really want to make it a good contest rig the Inrad Roofing filter Kit is an excellent addition. The 850 is a fantastic rig mine just keeps chugging along after 6 years of DXing and Contesting. Have fun with the 850.

I should have mentioned, one of my two TS-850S does have the two INRAD
400 Hz filters. As I mentioned earlier, I'm a CW op. Great points Roland.

In addition to the previous comments, The TS-850 as an option has a digital recorning unit that allows you to write and play back 3 voice messages. These messages can be accessed remotely with a simple push button and resistor network circuit. This will save wear and tear on the front panel keys.

I really like my TS-850. I bought it news years ago - but for various and sundry reasons had very few hours on it when I finally got my act to-gether about 18 months ago.

The only real problem that I had with it was having to replace the VCO 2 trimmer. A real pain..

Most of my operating is in contests - RTTY, CW & SSB

I bought a couple of 2.1 khz INRAD filters and recently a roofing filter.

The 2.1 KHZ filters are great for SSB, and when using them with the VBT for RTTY. A couple of 400 hz filters would probably be better (for RTTY) but I doubt that there would be enough of an improvement to justify the $300 cost.

The VBT with the 2.1 khz filters doesn't do much of anything for CW (I think that it's software issue - I posted something about a week ago) . - Right now, I use the VBT with the 2.7 khz filters - it works but not as well as I would like. This problem could be releaved somewhat by use of a DSP of some kind. I am tempted to try one of the the computer based options although the amount of computer activity that is going on now is almost excessive.

I have sort of kicked around the idea of taking the original 2.7 khz filters out and wiring the inrad 2.1s in their place & then putting a couple of inrad 500hz filters where the 2.1s where, but that would be a $300 hit...

What I will likely do is buy a 400hz 8.83 filter & stick it in the last empty filter slot. $130 is a little easier to justify to the exchequer than $300 - and of course I just spent $200 for the roofing filter.

I will say, that the combination of the 2x 2.1khz and roofing filter appears to work like gangbusters on SSB. Worked the CQ WW SSB contest last month and noticed little issues with bleed through of strong signals. Tuning is sometimes a little more of an issue depending upon the quality of the other station's audio.
I find that running the TS-850 with
1) the AIP (advanced Intercept Point) turned on (which actually turns the pre-amp off.
2) Manual RF gain control
3) AGC off
4) RF pads as required to reduce the atmospheric noise to nothing

makes a difference . I rarely touch the AF control - I usually ride the RF Gain - which on the -850 is concentric with the AF gain control anyway.

If I had the dollars & could find a late model ts850 I would not hesitate to buy it in an instant - nothing like having a standby!

10806. TS-450S - bad 6K 455 filter?

Hi all,

I just bought a very nice TS-450S (304xxx SN) from the original owner. So far everything seems to be working well with the radio, except for one possible issue: when switching to the 6K 455 filter, the noise and audio level goes *up* compared to the 12k filter. The 2.4k filter is nice and quiet as expected. The 6k 8.83 filter also quiets the receiver compared to the thru setting also as expected. The receive audio is nice and loud so the audio circuit seems ok. It is almost like the 6k 455 filter setting is more like a "thru" setting. I take it this is not normal behavior for the filter, but having no previous experience with the TS-450S, I thought I'd run it past the members of this board.

Is this an indication of a bad 6k 455 filter? Also, the previous owner had the C104 capacitor replaced which was leaking. There seems to have been some small amount of damage to the traces as well as extra solder on them from the repair. Is it possible that this may be the cause of my filter issue? Do I need to remove the 455 filters to see if there is any damage underneath?

Otherwise it's perfect. I love this little radio.

Thanks,
Darren

Villy,

My 850 is setup for filters like yours. But I do have a 400Hz filter also in the 8.MHz IF along with the 2.kHz filter and that combo works great for CW/RTTY. I was one of the first to get the Inrad Roofing filter and it is IHO the best for SSB contesting. So yes the $130 for the 400Hz is well worth it. Another addition if you want a great station is the addition of a 3 or 4 element SteppIR antenna of course it adds alot more on the cost of the radio but well worth it hi hi. With this setup and a SB-220 I have placed first in my catagory in Oceania many times I even got a first in the World in the 2010 CQWWWPX SSB for SOSB (A)20M Triband/Wires and my 3element SteppIR is only 33ft off the ground. Of course having a KH6 area call adds 300Db onto your signal ;-)

73 and gud DX

Thanks for that Roland.

I got a real chance to test out the roofing filter last night..

I was in QSO with VE7SQ when someone broke in. I could almost see the smoke pouring out of the receiver.. He was less than a km away from me with a dxcc antenna.

If the TS850 had an s meter it would have been wrapped around the stop!

As it was - I had to get almost 20 khz away from him before he dropped completely out of the picture !!!!

I wonder what it would have been without the roofing filter!!

I've been very happy with my BigIr. A beam would have been nice - but just not enough realestate - as it is, it's much close to the house than I would like and it is very radial poor.

On the other hand - managed 24 mode/band contacts for the recent Christmas Island operation - including 80 cw/ssb (with an honest 59 from them on SSB).

Heard them on 160 CW - too bad that there is no 160m loading coil available!!.

Had some fun in the recent CW SS, hopped to pick up some stragglers for CW WAS but no such luck - at least not yet (maybe someone hasn't updated theiry LOTW acct yet). Got the RTTY WAS last year (RTTY operators are 50% more likely to use LOTW!).

Maybe, I ask Santa for the 400 hz 8.83mhz filter for Christmas.

Hi Darren

This could well be so. My 690 also had the cap "go" which I replaced and gave the board a good clean - had the agc acting up. This was several years ago. Obviously I did not catch it quick enough and recently I experienced the same on the 455KHz 6KHz setting except mine was attenuated quite a bit. I removed it and replaced it with another one and inspection of the underside of the removed one revealed cracks in the plastic around the pins. So this may have arisen from some of the fluid from the leaky cap seeping into the filter or just humidity over time that may have corroded the internal connections to the crystal.
I had a "used" one off a comercial 455KHz IF strip so had nothing to loose. If I recall it's a 455HT IF filter.

Regards

Ron,

Thank you very much for the insight. I wasn't sure if I was even on the right track linking the C104 cap blowing with the 6k 455 filter issue. I didn't make the connection until I saw that the filter is right next to the C104 cap and close enough that it could have been damaged when the cap went bad. I will remove the cap and the filter, test the traces, resolder everything, and see if that does the trick. If I need to replace the filter, I'm not sure where I could get a new one, direct from Kenwood hopefully or out of a parts radio somehwere.

Really, it's not that big of a deal. The 2.4k filter works great for SSB, the mode I operate most. With the 8.83 filter at 6k and the 455 filter at 2.4, it's superb. The 6k filter would be useful only for AM or maybe hi-fi SSB, neither of which I use, but being a perfectionist, I'd just as soon have that capability if I ever wanted it. Come to think of it, having a working 6k 455 filter may come in handy for SWL.

Thanks,
Darren

I had been away for a couple months, and when I returned, my TS-850 wouldn't light up. Audio was working, but couldn't see the dark display.

Thanks to all of you who have provided this resource. (C18 on the display driver board had leaked and etched a couple traces on the board. US$ 1.50 at Radio Shack -- I know it was 5x the price, but it was just a block from where I had to be anyway, and at today's fuel prices, it may have been less expensive! -- and an hour of ringing out the circuitry to see which traces needed jumpers.)

(Sorry, Clif -- I thought I'd get to send the radio to you, but... maybe next time).

I've determined my TS-850 is late production -- serial # 309....

Do we expect the caps on the CAR board to be a problem on this later production radio?

Dan AA3LS

I have a small lot here but the house is on stilts so I got a 4.5 ft Glenn Martin Roof Tower and my 3 element steppIR is on the roof about 10M high. The lot is covered with landscaping and in is sloped by about 20 degrees since it is on the side of a Volcano (Dormant at this time)and the way the driveway and house are setup no place or a Vertical with radials.

Yea if a very close station is very strong 20Khz is about right to get rid of them in the receiver with he roofing filter 3Khz is fine or a S9+5db or less.

That's actually a early SN, they start at 20?. Be sure and check the carrier unit caps and the battery for leakage. Also look at C187 on the IF unit.

No problems here the more the owners fix the less I have to look at, GRIN...

Thank you all for the sound advice. 850 is on the way soon. 450 will need to move over and find it's way to the sales sites.

Mark

Thanks, Clif... I suspect inspection of the carrier board capacitors will cause me to remove them and then I might as well install new ones.

I replaced the battery some years ago with a battery holder and that's worked well. I think I got a battery holder for the coin battery style at a local (non-Radio Shack) store.

I'm getting pretty good at removing the screws by now. I'll put my magnifying viewers and bright lights to see what I can see on those other boards.

Thanks for the update about the serial number.

With a bright light look closely at the solder joints. They should be bright and shiny. Anything else and it's leaking. If one is leaking just replace them all. 10 total 10uf 16v SM caps and one 47uf 25v which I usually use a regular cap in place of. Most of the time the traces are gone when it leaks.

Hint: If the 47uf leaks; it's sitting over the TX bias line, it will short it and cause intermittent tx and soon damage the TRX module in the IF unit.

I have a friend who has a 850 that has a receive problems. It will start out either low receive or normal then it will crackle and either drop or become normal receive. He wants me to look at it I have a Service manual but just a O'scope and a 40M signal gen for 7.039Mhz.
Has anyone seen this problem and where was the problem. The radio is a 5Mil ser range.
Thanks

RF Unit. It's what protects the rx front end in tx. Should have 12v on the collector.

10829. TS850sat 40m band coverage?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-11-18 18:22:28 UTC
From: sadtenor
Topic: 10829 Message: 10829

Hello! I have just bought a TS850s with built in tuner. It seems to be working OK except for the 40m band where transmit is limited up to(the old portion of the band) 7.1 MHz. Is this the original setting or is something wrong? Can it easily be extended to cover up to 7.2MHz. Thanks for any help! 73 Jess G8IYE

10830. TS-450S - RX of both sidebands when filters on 6k or 12k

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-11-18 21:25:08 UTC
From: darren.ream
Topic: 10830 Message: 10830

Back again. I am sending the radio to Clif soon for repair of the inop 6k 455 filter I posted about earlier. Seems to be a result of a previously leaking C104 cap. I haven't sent the radio yet because I'm trying to do a really good shakedown first to see if there is anything else that needs attention while he has it.

I noticed that I get full, unattenuated receive of both sidebands when the radio is set on SSB and either the 6k or 12k filter is selected, unless the 2.4k filter is selected. In an earlier message, the poster had a similar issue when on FSK, that ended up being "operator error:" the unwanted sideband is not surpressed even on receive unless the 2.4k filter was selected...but I don't know if this is the way SSB works too, or just with FSK. I would think not since there are times that anoperator would want to listen to a SSB signal with only the 6k filter, ...but of course I could be wrong. Since the 6k filter has already been diagnosed as inoperative, I suspect this may be another symptom of filter problems.

So the question is: is rull RX of both sidebands with the radio on SSB and the 6k or 12k filter normal/proper behavior or is it indicative of another filter problem?

Thanks,
Darren, K7DKE

Sounds to me nothing may be wrong, its not the way the ssb works, but actually the way the filters work. It sounds normal to me. Of course I am not hearing your example audio..

Darren,

I just tried it on my 450, and it would appear that there is no unwanted sideband suppression in Rx with the 6KHz filters (both IF's) selected...

I think that answers your question.

Hi Clif,

Got the radio today and this is what I find on Q49 on the RF board.

Voltage to the radio is 13.88
On Q49
The Base has .040VDC the Collector has 11.40VDC and the Emitter has .0VDC and the voltages stay the same when it has good full receive or when it starts the crackling and the S meter drops by at least 4 S units once it does that the S meter goes up and down between S8 and S3 with a 50mV signal. So since it does not have 12V on the collector is it time to replace it or look at the components around it?

Thanks again for all of your help.

Hi Dan! The radio is 3rd hand so I'm not sure. It has always been in the UK as far as I know so guessing setup for Europe. Jess

The 12v is not an absolute so 11.4 is fine. What I have found is when the transistor starts breaking down is it will cause the crackling. Yoy might try removing it and see what happens. Or just replace it if you have another.

10837. Re: TS-450S - RX of both sidebands when filters on 6k or 12k

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-11-19 02:53:38 UTC
From: darren.ream
Topic: 10830 Message: 10837

Chuck & Dave, you guys answered it for me. So the filters work the same on SSB as on FSK and presumably on all modes. Unwanted sideband suppression depends on having the 2.4k filter in line.

I still have the issue of the 455 6k filter being totally inop, which is not uncommon after a C104 leakage, but at least I know the sideband suppression is working as it should. I guess for those times when you want to open up the receive bandwidth on SSB to 6k, you just better not have any nearby stations near the opposite sideband or you'd get some serious QRM. It would probably have been just a little too complex and expensive to build these radios with sideband suppression with the wide filters. Everything's a compromise. At least now I know a little bit about how this rig works.

Thanks!

Darren

UK counts as Region 1, right? When TS-850s were built, Region 1 hams only had 7.000-7.100, if I recall correctly, and Kenwood may have programmed the radio to keep you legal unless you modified it. There is a "60 meter" mod out there which actually enables transmit throughout the HF region, I think. Simple removal of a diode or two, and the mods description is pretty clear.

Darren, it is simply a question of where the BFO frequency is with regards to the filter passband. The 6 (or 12) kHz filter center frequency is basically where the BFO sits, and the 2.4 or other SSB filters frequency passband is to the side of the BFO frequency, so there is attenuation of the unwanted sideband. The wide filters were designed for AM and/or FM work, not SSB.

We used to call these kinds of things "WADs", for "Working As Designed", or features instead of bugs ;-))

This mod concerns only the UK kenwood TS-850S.

On the circuit board behind the front panel lies a bank of diodes
numbered D1-D11 all diodes are there except for diode D10 to unlock the
uk TS-850s to full transmit.

Just cut or remove diode D11.

Perform full cpu reset, when powering unit after modification for full
reset press and hold A=B while turning on unit ......

(mods.dk is your friend here....)

Thanks again Clif you are the best.
After removing the transistor it does not crackle anymore and the receive signal stays steady and does not fluctuate at all. So I will order some from Mouser and since I have a 850 also I will have spares in case mine does the same thing. What one is the best to order the DDTC124EKA-7-F from Diodes Inc. or the DTC124EKAT146 from ROHM they are $.05 less then the Diodes Inc. ones?

This feature is very useful when calibrating the master oscillators of other devices, such as frequency counters. For example, if the master oscillator is 10 Mhz and you can set the TS-850 to 10Mhz SSB with both 6Khz filters selected and tune to WWV. Let the master oscillator of the counter and the radio warm up. Place an insulated coupling wire inside the device near the master oscillator. Set the tuning speed to fine and slowly tune the receiver until you are at zero beat with WWV. When you approach zero beat, the audio frequency will drop and you will get a rise and fall of the receive audio. Continue to tune the receiver until that rise and fall of the audio dissapears. Disconnect the antenna and connect the coupling wire into the radio's antenna jack. Adjust the device's master oscillator for the same zero beat and your all set. You will probably have to switch back and forth to keep the radio tuned to WWV. An anntenna swtch would make it easier.

10845. Using Maxim ICL7662 to replace DC-DC converter in TS-850

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-11-21 20:38:52 UTC
From: MD
Topic: 10845 Message: 10845

One of my 850's has contracted the oscillating ALC sickness. I have found multiple references to this being caused by the DC-DC converter daughter board on the small RF board going bad. One of the solutions found was to replace the whole board with a LCT1144. Since neither Mouser nor Digikey carry the LCT1144 I ordered a Maxim ICL7662 from Mouser to do the job. Has any one else ever done this? Any pitfalls I am overlooking? Any input at all would be appreciated before I probably destroy the DC-DC board trying to get it out.

I'm curious as to why not replace it with another board from Kenwood??

The 7662 is going to output a -13-14v which will have to be reduced to -6 via either a zener or voltage regulator IC. More circuitry.

Clif

Topic: 10845 Message: 10847

I was unaware it was available from Kenwood. I am so used to parts on these rigs that are getting long in the tooth being discontinued. I never checked. I will order 2 from East Coast today. To answer your other question. I had planned on reusing the existing zener and capacitor filter circuitry that is on the main board. Thanks for the info. That is why I love this group and especially like your willingness to share your knowledge Clif.

I am having to replace the DC-DC board on one of my 850's. While it's on the bench I have replaced the battery and moved it to the fan compartment, replaced C18 on the display board and will be replacing the caps on the CAR board. I am using 24v 120 deg. caps for all replacements. What other issues should be addressed while it is on the bench?

While I had it apart, I would also do the all frequency transmit, and
the BC band attenuator bypass.

10852. TS-450 or 850 Transmit Frequency Adjustment

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-11-23 02:23:25 UTC
From: k9zy
Topic: 10852 Message: 10852

My 450 is transmitting about 60 hertz lower than is indicated on my radio readout.

Does anyone know how I might adjust that, or calibrate it back to on frequency? I saw a post for the 850 receive adjustment, so hoping someone knows how to adjust/calibrate transmit on either 450 or even 850.

Thanks,
Mark

10853. TS-450S Tuner

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-11-23 04:51:58 UTC
From: Jamey Wright
Topic: 10853 Message: 10853

What is a reasonable expectation for the tuner in the TS-450S internal tuner? On 75M, at 3.835, I have an SWR of about 2.6:1. The internal tuner will not tune here. It runs up and down and then the rig starts beeping and does so until I hit the AT Tune button.

Thanks

Jamey Wright

10854. Re: TS-450S - RX of both sidebands when filters on 6k or 12k

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-11-23 15:56:39 UTC
From: darren.ream
Topic: 10830 Message: 10854

Hi Eric, thanks for that simple explanation In fact, that's how I tune the master oscillator in my old HP frquency counter, except that all I have to do is lay the coupling wire I use from the counter along the back of the rig, and that gives me enough signal to tune the master oscillator. Also, the way I tune the rig's master oscillator is very easy with the filters set on 6k or 12k in USB or LSB I can then zero beat the two sidebands. On my spectrum analyzer it's very cool to watch the two lines come together as ytou zer beat the two sidebands. It doesn't matter which sideband you have the rig set to, USB or LSB, with the wide filter you can always hear both equally well. WAD/"works as designed." I like that. Just like any device, it has its quirks and once you understand them, can use those to your benefit. It would be nice to be able to select a wide filter on SSB and have the other sideband suppressed, by having the center frequency of the 6k filter moved one way or another 3k when in SSB mode, for ESSB for instance, but that would be quite complex to engineer. But I really like this TS-450S and the more I learn about it, the more I appreciate the design.
Thanks,
Darren

--- In TS-850_450_690@yahoogroups.com, "rick54045" <rick54045@...> wrote:
>
> This feature is very useful when calibrating the master oscillators of other devices, such as frequency counters. For example, if the master oscillator is 10 Mhz and you can set the TS-850 to 10Mhz SSB with both 6Khz filters selected and tune to WWV. Let the master oscillator of the counter and the radio warm up. Place an insulated coupling wire inside the device near the master oscillator. Set the tuning speed to fine and slowly tune the receiver until you are at zero beat with WWV. When you approach zero beat, the audio frequency will drop and you will get a rise and fall of the receive audio. Continue to tune the receiver until that rise and fall of the audio dissapears. Disconnect the antenna and connect the coupling wire into the radio's antenna jack. Adjust the device's master oscillator for the same zero beat and your all set. You will probably have to switch back and forth to keep the radio tuned to WWV. An anntenna swtch would make it easier.

I haven't sent the radio yet because I'm trying to do a really good shakedown first to see if there is anything else that needs attention while he has it.
> >
> > I noticed that I get full, unattenuated receive of both sidebands when the radio is set on SSB and either the 6k or 12k filter is selected, unless the 2.4k filter is selected. In an earlier message, the poster had a similar issue when on FSK, that ended up being "operator error:" the unwanted sideband is not surpressed even on receive unless the 2.4k

filter was selected...but I don't know if this is the way SSB works too, or just with FSK. I would think not since there are times that anoperator would want to listen to a SSB signal with only the 6k filter, ...but of course I could be wrong. Since the 6k filter has already been diagnosed as inoperative, I suspect this may be another symptom of filter problems.
> >
> > So the question is: is rull RX of both sidebands with the radio on SSB and the 6k or 12k filter normal/proper behavior or is it indicative of another filter problem?

I wouldn't do the BC att bypass unless;
1. You live out in the sticks and
2. You are an avid BCB DX'er

Otherwise you are inviting all sorts of strange noises on other bands from BCB interference.

Date: 2011-11-26 04:15:34 UTC
From: MD
Topic: 10860 Message: 10860

I replaced the the small Rf board in front of the Car board in order to fix a bad DC-DC board. Every thing worked great for an hour or two. I went to tune my amp on 80 meters using my ameritron tuning pulsar in CW mode. It stopped receiving and transmitting. I think I smelled something but it was very faint. In receive mode on the If board the TXB is 2.27V, RXB is 0.0V and the 8V is 8.01V . The "on air" led is very faintly glowing when in receive. There is absolutely no sound coming from the speaker and the RF gain does not get any agc on the meter when it is turned down. I removed C1 on the Car board and there was no leakage. In the process of replacing C1 I learned I do not want to change any more SM caps. I got it replaced but it is beyond ugly. I honestly don't think the new RF board has anything to do with it since neither the RXB or TXB go in our out of it. Anybody got any ideas what to check next?

Thanks

Subject: [TS-850_450_690] TS-850S Electronic Keyer - Switch Dots and Dashes?

Is it possible to switch the dots and dashes on a TS-850S using a Bencher
paddle electronic keyer without physically switching the paddle wiring. I
thought Function #22 "Reverse Mode" would switch the dots and dashes, but
I'm not sure what this function does? Can someone help?

Thanks,

Glenn - K4ZOT

Hi Tony, thanks for your response. I am looking specifically for the boxes for the TS-450S and TS-850S HF radios. One of my TS-450S's is going right into long-term storage, so I'd really like to find one of those asap.
Thanks,
Darren

10870. Re: TS-450 or 850 Transmit Frequency Adjustment

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-11-30 17:15:26 UTC
From: k9zy
Topic: 10852 Message: 10870

This is a bit different than the readout calibration. It is in neither the 450 nor 850 user or service manuals.

I need to adjust only the transmit frequency. It can be done temporarily via the XIT adjust control on teh radios, but I'm trying to calibrate that "zero" setting up 60 Hz. I'm sure it is one of the adjustments on the board given this must be set at some point by the factory. Just don't know which one.

Does anyone have experience adjusting or calibrating the Transmit frequency on a 450 or 850? Receive calicration is fine.

Thanks,
Mark
K9ZY

I am listing a TS850SAT with RS70 Power supply on behalf of a ham in failing health. The radio and ps are 17 years old and operational. The 850 is fully loaded and has the voice module in it. These are pickup only in the Eugene, Oregon area. $600.00 Firm. Call 541-487-4009 or email me off list, please.

Thank you to the group for allowing me to post this.

Dave Frechette, K7QT

Topic: 10873 Message: 10873

Hi all, I just acquired a ts850sat with some issues. At first it only transmitted on ssb, and that was on three bands and no cw or fm on any band. Yesterday I let it stay on for a few hours and today it seems like everything works except the sidetone. The rig WILL key, and output power, but no audible sidetone. I adjusted pot VR5 to the max and I hear an extremly faint sidetone now, you have to really strain to hear it so it's not enough to be useable. I do mostly cw so any help would be appreciated. I always wanted a 850. Thanks, Jerry.

Hello Mark

The only adjustments that affect Recieve and Transmit frequency that I am aware of are in the service manual. For the TS-850, they are on pages 98 and 99. If your frequency counter and volt meter are properly calibrated to NIST you should be able to get the alignment to the point were you would not be able to tell the difference. It is fairly easy to calibrate a frequency counter using WWV as the signal reference. The volt meter is another matter. The alignment specifications for the 850 specify a tolerance of + or - .03 volts in some cases. To get this type of accuracy, the volt meter used to adjust the VCOs must have a current calibration directly tracable to NIST. Unless you are willing to use a top notch voltmeter recently calibrated at a labratory calibration facility you can't expect the TX and RX frequencies to be "Spot on".

The VCO voltages do not determine the frequency, they set one end of the lock range and are not that critical, a tenth of a volt is fine with about any voltmeter. Trick is to check the other end and make sure it's OK. You may have to tweak the start to keep it in lock throughout the range.

But that's not your problem anyway.

The RIT, IF Shift, and Car oscillator frequencies are set by the processor in the service menu. That's where you need to be, WITH the proper test equipment.

Clif

Start with reset and try again on copying USB and LSB.

Thanks Clif, I tried it and no change. There is a slight attenuation on the sideband that shouldn't be readable. I haven't made a QSO on either sideband so far, so I don't know if it affects SSB transmission. The no CW output except on CW-R along with no sidetone output haven't changed. That bugs me the most.

What are the filters set to?

The sidetone is generated by IC3 on the Car unit.

You need a 'scope and a freq counter to check out the Car unit.

Guys, While we're talking about side tone, does anyone know if the side tone mod (volume adjustable via the "mon" control) results in a louder side tone? My only complaint about the 850 is the low volume side tone. Yes it's turned all the way up.Thanks, Bob WE6C

Interesting Bob... My sidetone is certainly not turned up to the max, and I like it pretty loud (I use QSK and need to be able to hear it above the pileup -- and my hearing loss, too!) and it's plenty loud enough. I have a 450, and thought the 850 would have been the same circuitry... Maybe Cliff will offer his expertise...

Cheers,
Chuck, WA3CEJ

Bob, I did the sidetone mod on my 850 a few years back.
The sidetone would deafen me in short order if the monitor
volume was turned up all the way.

Normally it's set at about the 9 o'clock position - (red line
at "2" on the front panel).

Alan, KD5R

Chuck, Alan, Thank you very much. I do plan on sending my rig to Clif sometime this winter for a "tune up" so I guess I'll ask him if he would be willing to do that mod for me.
I took my 850 to field day which is at a somewhat noisy location. I had a hard time hearing my own side tone since I do use QSK most of the time.
I have also double checked the side tone adjustment inside and it's at max.
Thank you guys, I know what to do now.

Hi!
Most probably a case of impedance mismatch. the collins filters likely have higher impedances than the standard (lo -Z) kenwood filters. Try some resistive L-pads and see if things improve. If they do, time to get into the math for exact component values.

10888. TS-850 ALC

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-12-07 19:45:20 UTC
From: n2vww
Topic: 10888 Message: 10888

I have a 3rd hand 850 that had the ALC fluctuating problem. I replaced the DC/DC converter board and adjusted the ALC voltage at TP-3 on the RF board.

I now have no indication of ALC when transmitting 100W ssb with the meter set ALC.

I think I should adjust the ALC as in step 25 on page 103 of the service manual.

Here is my question; In the adjustment procedure it states that VR7 is set to max and VR8 is set to minimum. Then the power out is set to 100W max with VR7, is VR8 left at the max position?

I am a little confused with the manual.

Thanks

Hi Dave.

Yes I did turn up the carrier level when I transmitted cw into the dummy load. It made no differnce.

I think someone tried adjusting the ALC when the actual problem was the DC/DC converter board.

I just need clarification on the adjustment as it is stated in the service manual.

Thanks

You followed step 25 which sets the max power out in CW mode to 100w measured on an external wattmeter. VR7 sets the power level. VR8 is the protection setting and requires a 3-1 dummy load to set (step 36).

Now go to step 34 and set the ALC meter, you will need an audio generator with calibrated output.

Thanks for clearing that up Cliff ! I did'nt read far enough in the manual.

I guess it is time to send the 850 in for alignment because I do not have calibrated test equipment.

I am new to this group however I service all my own radios. Most are military though. The service manual for the TS 450 requires a calibrated audio output signal of 5mv, 10 mv and 20 mv and my question are these audio outputs peak to peak, average, RMS, I am guessing peak to peak.
I also am having trouble finding the service manual print out for the display board as my display seems to have icons that are always on, never turn off, and the 10s MHz diget has 2 segments that are always on. I would like to look at the driver lines for the display to see if I have a bad driver or a bad display.

Topic: 10894 Message: 10894

I recently bought a TS850S second hand and I noticed that you hear when listening to a crackling sound heard. If I reduce the rx the crackling disappears, I noticed that when I turn the NOTCH filter the crackling disappears but then I get the popping especially strong signals around the band. so I'm curious if there is a problem with the AGC on this radio or on the audio portion.
I also noticed that the AGC SLOW position is like in FAST.
TS850 I was wondering if other users have experienced this problem or have any advice for me. I am anxious to get rid of it because it makes the band sound louder than they really are.

Sincerely, Nino

Thanks Dave.
I found the dealership here in Italy which provides the Kenwood TS850 parts, and days I will send the transistor.
I'll let you know ....
I miss just a few pictures of the exact position of the RF transistors on the board. I saw that in some past discussion, someone said to have the photos ... I will try to contact him.
Thanks again and the next.

Nino

10903. Analog S meter

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-12-11 01:09:21 UTC
From: Randy Turner
Topic: 10903 Message: 10903

I was thinking... (watch out) I had a Yaesu FT-857 for a brief stint. I built an external S meter for it out of an old SWR meter using its rear jack. I would LOVE to do that for my TS-850. Obviously it has no rear meter jack, but, I know all I need is access to the AGC voltage, correct. Would pin 6 on the "ACC 2" Jack allow me this function, or would it effectively divide the voltage by 2 between the existing meter and the analog one, giving me erroneous readings?

10904. TS850 Dropping / No TX on SSB

Hi to All

My brother TS850 started to develope a problem, TX is abnormal put out 10watts only on SSB but there are time it will put out 100w. On any other mode FM or CW it has full 100w output. When he turn on the monitor on the radio during TX he can hear his audio, i assume the audio path is ok but no output on SSB.

Anyone experience this problem and any info how to trouble shoot this kind of problem?

Thank you,
Alex

Date: 2011-12-16 07:08:37 UTC
From: Rein A
Topic: 10915 Message: 10915

Hi All,

My beloved TS-850 has been used in monitoring around the clock for
a long time. Today a storm came through the area, with some remote
weak, distant lightning. No close hits though. Not even sure it is even related.
I found the radio in send mode, no way to get it out of this mode.
It is actually producing output, though the antenna tuner is not
working.
I have no illusions about the set, but perhaps there is help or idea's here?

30amp supply on my bench and 25 amp at his shack. If I crank down the power to just above the far counter clockwise or number 2-3 it is ok but once it goes a\bove 3.5 and above it is drawing well over 30 amps and power out is over 150 and nobody put the Golden Screwdriver to it. It just started doing it by it's self.

Hi,

You can find those upgraded chips, sometimes at ebay when there is a separated parts of a TS850, price usually reach above $100, ave is $150.

Good luck

I know this sounds silly, but you didn't hit the 'send' button my mistake?

You might also unplug the mic and make sure the key isn't shorted somehow.
73
Tom W7WHY

Hi All,

My beloved TS-850 has been used in monitoring around the clock for
a long time. Today a storm came through the area, with some remote
weak, distant lightning. No close hits though. Not even sure it is even
related.
I found the radio in send mode, no way to get it out of this mode.
It is actually producing output, though the antenna tuner is not
working.
I have no illusions about the set, but perhaps there is help or idea's here?

73 Rein W6SZ

Power on reset? Does it power off? The Power on CPU reset may clear some faults. Cheap if you don't mind losing your memory contents.

From: Alex
Topic: 10920 Message: 10921

Hi,

My advice dont order from any of them, in any seller in china, we were fooled by a seller in china already,they thought they still have the ic on their stock, send us quotation then we send the money. luckly the store were we send the money returned our money less the telegraphic transfer cost to them. And told us it is not available anywhere in china

Few will do like this returning the money, we were just so desperate to get this IC YM66312, some will quote you low,some high and asking to send the money. The DDS IC is NOT available anywhere.

The only way to get it is 2nd hand, from a good working board maybe from ebay. I bought our board from ebay to repair a TS450S, price range from $80 to $120.

Good Luck

Sewing machine oil is good, as long as it is not '3-In-1' oil. That has a parafin base which will get gummy after a while. A sewing machine shop will sell really good sewing machine oil. 73

What is a mrp40

Is the signallink still a vox ptt like the sl1+. Maybe its just your audio out of the sound card is not high enogh, or if it has them, adjust the controls inside the signal link. I have used a sl1+ on my 850 (same wiring, via the 13 pin connector)

The Signalink USB sound card work fine on PSK-31 at less than 1/2 on the transmit drive knob so I assume the sound card is fine, MRP40 is a CW send and receive program. I also use the 13 pin plug. I am still looking around.

Hello All,

Thanks to those that answered my email.

I am glad to report that the problem got solved though I did
not find it myself!
What happened was that the PTT line, coming from the 13 pin
connector, had a leaking capacitor pulling the PTT line into
transmit. Once you know, a trivial error.

Though I switch that PTT line with an opto-isolator, some excess
voltage might have zapped the capacitor into a semi conducting
state. (20 Kohm leak current)

It could also have been just a failing capacitor starting to leak after some 18 years.

My thanks to N6AX.

10940. TS-850: power goes up, ALC action goes down. Why?

Topic: 10940 Message: 10940

I read all the previous posts I could find on ALC (including Clif's "ALC 101"..hi, hi..), and I still can't conceptualize this. It doesn't seem to be the DC-DC board problem since PWR remains steady.

Help me understand the theory here. I have two TS-850's and they both do the same thing: ALC action (deflection) is greatest with the RF power control set at 10 o'clock, or about 25W with a steady tone. As I increase PWR, power output goes up all the way to 100W as expected, but ALC deflection goes down. At max mic gain the ALC meter reading only barely registers a couple dots. I crank the power back to the 10 o'clock setting and the ALC comes back up and shows full deflection with the steady tone and on voice peaks.

This is true on all bands, into the antenna, or into a dummy load. ALC or PWR does not fluctuate. Even with a steady 1kHz tine injected, as I increase PWR, the ALC smoothly decreases in inverse proportion.

The problem is that it makes mic gain adjustment via the ALC impossible. Even with the mic gain all the way full at 5 o'clock and clearly overdriving, I barely see any ALC deflection. So at normal full PWR output, I simply rely on the power meter and reduce mic gain until I am only seeing about 75% of max AVG power, like I would on a rig without an ALC meter. I don't distort, get good audio reports, so I don't worry about it in normal operation.

But I know I am missing something here theory-wise, and if I understood what was going on, I'm sure I could be a better operator.

So I guess my question is, help me understand why ALC deflection goes down to practically nothing at full PWR even with mic gain cranked all the way up. And why it goes up to max deflection when PWR is cranked back to 10 o'clock.

Love this board and its members...so many mysteries solved by just a simple search through the archives!

Thanks,
Darren

I guess you were apologizing for mixing up names.

I was thanking you for reporting the resolution, which doesn't always get reported, so some fixes have to be re-discovered.

Thanks again... I wasn't trying to complain in any way!

What is the max power out on 20m into a dummy load measured on an external wattmeter?

Clif, I'll have to get back to you next week when I get my wattmeter back that I loaned out to a friend. I have no less than 3 wattmeters and they are all spread to the four winds right now. If it helps, into a dummy load on 20m, output shows one bar less than 100W, so that would be 90W I guess. This is with a steady 1.4kHz tone. When I talk on SSB, with the mic gain adjusted how I usually run it (10 o'clock) I typically see around 25W-40W watts on peaks. Since the meter is peak reading, this means I'm running pretty conservatively, which is pretty much my philosophy with everything.

Thanks,
Darren

Topic: 10940 Message: 10945

Same. With PWR and CAR cranked all the way full, 90W shows on the internal meter & ALC is just past the red ALC zone. When PWR is reduced and CAR left at full, ALC increases until pegging full scale when power is down to between 25W-40W. Just like on SSB.

However, when PWR is left at full and the CAR is reduced instead, the ALC action seems more normal: as CAR is reduced, ALC starts dropping first and drops all the way to nothing right as the power meter finally starts to begin dropping from 90W. This point where ALC just reaches zero but the meter still reads 90W is at about 1 o'clock on the CAR control. 5 o'clock to 1 o'clock on the CAR control sees the ALC smoothly drop from just past the ALC red zone to nothing. 1 o'clock to 9 o'clock sees the power smoothly drop from 90W to nothing with the ALC staying at zero.

Both power and ALC meter action is very smooth, there is no erratic jumping around with either indication as I move the controls.

10947. TS-450 intermittent no output

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-12-26 00:15:23 UTC
From: wi2g
Topic: 10947 Message: 10947

I have a TS-450, bought new, which developed such a severe intermittent on transmit (output would drop from 100W on CW to nearly zero; I was still barely-audible by the other station) that it was no longer reliable transportation. The fellas in Virginia Beach couldn't replicate the problem, although it doesn't seem to be antenna- or power-supply-related. Is it possible my long-ago MARS mod may be to blame? I'd like to resurrect the rig (which worked well until the intermittent) as a backup for my 570. Tnx for any help and happy holidays de Anne WI2G

Anne, maybe you already did, but I would suggest to first have a look at
the fuseholder(s) and fuses in the powerlead.
Clean them untill they are shiny, and there is no residue from whatsoever.
It is a common failure after some period of time, the same as the
molex-type powerplug.
After some time of use, it will defenitely run hot because of a bad
connection.
(only need 1 Ohm at 20 A for some heat!).

Happy New Year!

73, Joop Schalkwijk / PD2JAM.

Topic: 10949 Message: 10950

It only stores one setting per band so do a tune on that band and it will change.
OR do a reset on the radio, that clears the tuner memory on all bands.

Thanks Cliff ,
I do not use my auto tuner often , because I do not get as good tune as my manual tuner [Palstar AT2K] and using antenna analyzer [MFJ 269] to tune the manual tuner .
The auto is quicker , and now I have some new RFI/EMI in the area that affects my analyzer .
I am checking out some of the auto tuners , like Palstar etc. , but want to do some testing to see if I can get them to keep the SWR & reactance as low as I get with the man. tuner & analyzer ?
Thanks John

Hi Clif. First of all thanks for helping me with this issue. I have no shame and am to be the test subject showing my ignorance for all to see in order to publicly document and explain this ALC phenomenon.

Back to business, I got my external wattmeter back today (a KW AT-230) and it shows the exact same behavior as I previously posted except that now the readings are about 10W higher at peak. 100W out at the wattmeter and 90W out at the internal bar-graph display. That and the range of full-scale pegged ALC indication is now 25W-60W as compared to 25W-40W before.

loaned out to a friend. I have no less than 3 wattmeters and they are all spread to the four winds right now. If it helps, into a dummy load on 20m, output shows one bar less than 100W, so that would be 90W I guess. This is with a steady 1.4kHz tone. When I talk on SSB, with the mic gain adjusted how I usually run it (10 o'clock) I typically see around 25W-40W watts on peaks. Since the meter is peak reading, this means I'm running pretty conservatively, which is pretty much my philosophy with everything.

> > > > > >
> > > > > > Help me understand the theory here. I have two TS-850's and they both do the same thing: ALC action (deflection) is greatest with the RF power control set at 10 o'clock, or about 25W with a steady tone. As I increase PWR, power output goes up all the way to 100W as expected, but ALC deflection goes down. At max mic gain the ALC meter reading only barely registers a couple dots. I crank the power back to the 10 o'clock setting and the ALC comes back up and shows full deflection with the steady tone and on voice peaks.
> > > > > >

Not a problem for me.I was fully expecting to see a large increase in the power level on the external meter. If it's showing 100w with Car and Pwr at full I'm getting short on ideas. I don't have to tell you what it should be doing so all I can say it doesn't make any sense.

Have you monitored the 13.8 inside the radio while trying the test? Also look at the -6 supply. Something is strange....

Clif

Power out on other bands is a little higher: 160, 80, & 40, it is 120W out, 12 & 10, it is 115W or so. But on 20, 17, & 15, it's about 105W. Don't know if this makes any difference. ALC action is the same on all bands. I get 13.8V inside the radio (where the power in connects to the board).

Also, just noticed my crappy ol' dummy load has a 2:1 SWR. Maybe this is making a difference? I am ordering a new dummy load today.

Perhaps I might just not worry about it then. It does not affect operation, the radio puts out good audio & full power when I want it, and runs great with the mic gain set at 9-10 o'clock, how I generally run all my other Kenwoods. Funny I can't get it to overdrive even with the mic gain cranked all the way open...still get good audio reports and sounds fine through the monitor. This is with my Heil, tonight when I get home from work I'm going to see if I can get it to overdrive with the stock hand mic.

My other 850 is stored away and now that I think of it, I did not notice this issue until I started using this 850, so I think now it is just with this radio. Perhaps it just needs a good alignment including the ALC circuit & metering?

Darren,

Did you put an ohm meter on that dummy load to make sure it is defective?
I don't usually see a dummy load drift that far off. It is often an issue
with the cable(s) and/or connector(s) between the dummy load and the radio
that are the problem.

10956. Frying noise on TS850 in AM receive

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-12-28 16:07:39 UTC
From: g8lyv
Topic: 10956 Message: 10956

Hi, I have been getting a frying noise in AM receive. I turned the RF gain right down and the noise is still there particularly when I turn the AF gain up in AM, all other modes are fine.
I shorted either side of the detector diode to ground, no difference. Bridged the 4066 switch, pins 1 and 2, no difference. Changed out C101, the coupling cap into the 4066, again no change. I am guessing it's a noisy 2sc2712-y, Q17 on the IF board, or it could be the 1 meg resistor, R120.

Anyone seen this before? Any thoughts on what it might be?

73's Kevin G8LYV

10957. Re: TS-850: power goes up, ALC action goes down. Why?

Kem thanks for the reminder. And yes, my dummy load is in fact crap, as it reads 90 ohms. It was new off fleaBay. Guess I deserve what I got. It doesn't seem to make much difference as into my antenna (with proper ID, of course) the readings are the nearly the same.

I couldn't stand the curiosity anymore and unpacked my old TS-850 and ran through these tests. Everything was perfect with my trusty old 850! It has max 130W out on the external meter and showed beautiful proper ALC action: Power out hit the max at about 3/4 the way on the PWR control and then everything past that just increased ALC and power out stayed constant. Nice good ALC action as I increased the PWR past max and the ALC kicked in limiting power out. I am reminded how much I like this particular radio, which by the way, I was going to sell. But now I'm having second thoughts...

I emailed Clif and my "new" 850 is off to Avvid for some expert care. I'll post back and let the group know what the problem was.

Thanks for the help and advice.

Darren

Darren, I know this has little to do with your thread, but I 'wanted' to sell one of two hf transceivers due to little radio time and $, I chose to sell an Icom pro III over my TS-850/DSP-100.

10959. Gas filled tube on the TS850

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-12-30 08:24:41 UTC
From: pauldebono@rocketmail.com
Topic: 10959 Message: 10959

Hi all.
All the best for 2012 to all.

If two gas filled tubes happen to be either in parallel or in series in a circuit, what will be the effect ? Reduced or increased trigger voltage, effect of the circuit impedance etc etc . Typical example is when you have a tube up at the antenna end and another one at the rx front end input of the TS850 !.

10960. RE: [TS-850_450_690] Gas filled tube on the TS850

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-12-30 13:25:40 UTC
From: condor@cox.net
Topic: 10959 Message: 10960

In parallel, the lowest rated tube will trigger. In series, the trigger voltage will be the sum of both tubes - no change in the feed line impedance with either setup, since they are not part of the circut until they trigger.

Doesn't count as there are components between the 2. They have to be connected together.

FWIW the 850 only has one at the ant jack.

Happy New Year 2012 to the list

GA, just wanted to wish all list members and their families a very Happy New Year 2012!
Hope to see some of you on the bands in 2012.

10963. TS-850SAT - a few questions

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2011-12-31 13:01:21 UTC
From: KG0WX
Topic: 10963 Message: 10963

My S/N equals March '94, 3rd unit produced so I've got a fairly new model. It has two problems:

The tuner won't stop tuning until it gets a 1.2:1 swr - I'd like to adjust it so it is not so finicky. A 1.5:1 swr is fine by me.

The rx is acting like a 20db pad is in place but which fault is to blame? I would think it's the Q49 issue because according to the Kenwood service bulletin my unit should have the D31 mod already done. (Service Bulletin no. 1006 (22 January 1993)).

Which side of the RF unit is D31 on? Could my unit have this problem or did Kenwood address the issue in my unit, therefore it HAS to be Q49? How do I adjust the internal tuner?

Ken

10964. RE: [TS-850_450_690] TS-850SAT - a few questions

From: Dave Gmail
Topic: 10963 Message: 10964

When mine did that it was actually resistors r1 and r2 that I replaced to solve the problem q49 was for noise on rx (noisy transistor), I may have the blow up still if I can find it, this was Also on the backside of the board

The radio wants 1.2:1 at 1.5 it's starting to fold back.

Q49 is a 20db pad for the front end switched on in TX. It can be noisy but if shorted, down 20dB.

If D31 is bad there is zero rx as it kills the RXB.

If the ATT resistors are open they only affect it when the ATT is selected.

From: ninorusso1959
Topic: 10894 Message: 10967

I thank both Dave (on the technical side) and Jose (for the photos sent me by e-mail) ... q49 problem is solved! But I still have not solved the problem of AGC.
Slow is strange position as if in fast. I checked the entire AGC circuit of the time and it seems OK (capacitors and resistors ok), I checked the chip AGC drive and it's OK, I checked the voltage at TP1 and it's OK, what did I miss ?????
Have any of you had this problem?

regards Nino

If the ATT is set to 0 the resistors are bypassed by the relays and out of the circuit.

There appears to no longer be any output from the "IF Output" jack on my TS-850.

Short of sending it to Clif for repair, is there anything I can check?

The jack may have come unsoldered from the board. I had that happen to one of mine once. It's a very simple repair.

10975. problem with the AGC TS850SAT

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-01-02 18:05:51 UTC
From: ninorusso1959
Topic: 10975 Message: 10975

I have a problem with the AGC TS850SAT.
The AGC SLOW position is wrong, it's as if he were in fast.
I checked the entire AGC circuit of the time and it seems OK (capacitors and resistors ok),
I checked the drive control chip AGC and that's fine, I checked the voltage at TP1 and
that's okay, what am I missing?? ?
Have any of you had this problem?

Nino

I was using the IF out to a SDR-IQ until a few days ago when it stopped working. I don't have a scope to know absolutely for sure the IF Output is dead, but I've checked out the cabling and the SDR and they work fine connected to an antenna.

Subject: [TS-850_450_690] Re: TS-850: power goes up, ALC action goes down.
Why?

The jack may have come unsoldered from the board. I had that happen to one
of mine once. It's a very simple repair.

I was using the IF out to a SDR-IQ until a few days ago when it stopped
working. I don't have a scope to know absolutely for sure the IF Output
is dead, but I've checked out the cabling and the SDR and they work fine
connected to an antenna.

From: w8nf
Topic: 10940 Message: 10979

This is normal behavior.

The "PWR" control is in fact, setting the ALC's target power output. Therefore, in order for the ALC circuit to REDUCE power, it has to INCREASE ALC action.

In carrier-based modes (AM, FM, CW), you're supposed to reduce the CAR control until you get very little ALC action at your chosen power level. This avoids keyclicks, overshoots and various other distortions.

The PWR control is almost unnecessary...for CW, leave it cranked all the way up and use the CAR control to adjust power output. For SSB, use the MIC GAIN control to control power out. Your neighbors on the bands will thank you.

73,

Dave W8NF

> Power out on other bands is a little higher: 160, 80, & 40, it is 120W out, 12 & 10, it is 115W or so. But on 20, 17, & 15, it's about 105W. Don't know if this makes any difference. ALC action is the same on all bands. I get 13.8V inside the radio (where the power in connects to the board).
>
> Also, just noticed my crappy ol' dummy load has a 2:1 SWR. Maybe this is making a difference? I am ordering a new dummy load today.
>
> Perhaps I might just not worry about it then. It does not affect operation, the radio puts out good audio & full power when I want it, and runs great with the mic gain set at 9-10 o'clock, how I generally run all my other Kenwoods. Funny I can't get it to overdrive even with the mic gain cranked all the way open...still get good audio reports and sounds fine through the monitor. This is with my Heil, tonight when I get home from work I'm going to see if I can get it to overdrive with the stock hand mic.
>
> My other 850 is stored away and now that I think of it, I did not notice this issue until I started using this 850, so I think now it is just with this radio. Perhaps it just needs a good alignment including the ALC circuit & metering?

> > > > >
> > > > > However, when PWR is left at full and the CAR is reduced instead, the ALC action seems more normal: as CAR is reduced, ALC starts dropping first and drops all the way to nothing right as the power meter finally starts to begin dropping from 90W. This point where ALC just reaches zero but the meter still reads 90W is at about 1 o'clock on the CAR control. 5 o'clock to 1 o'clock on the CAR control sees the ALC smoothly drop from just past the ALC red zone to nothing. 1 o'clock to 9 o'clock sees the power smoothly drop from 90W to nothing with the ALC staying at zero.
> > > > >

> > > > > > >
> > > > > > > Clif, I'll have to get back to you next week when I get my wattmeter back that I loaned out to a friend. I have no less than 3 wattmeters and they are all spread to the four winds right now. If it helps, into a dummy load on 20m, output shows one bar less than 100W, so that would be 90W I guess. This is with a steady 1.4kHz tone. When I talk on SSB, with the mic gain adjusted how I usually run it (10 o'clock) I typically see around 25W-40W watts on peaks. Since the meter is peak reading, this means I'm running pretty conservatively, which is pretty much my philosophy with everything.

> > > > > > >
> > > > > > > Help me understand the theory here. I have two TS-850's and they both do the same thing: ALC action (deflection) is greatest with the RF power control set at 10 o'clock, or about 25W with a steady tone. As I increase PWR, power output goes up all the way to 100W as expected, but ALC deflection goes down. At max mic gain the ALC meter reading only barely registers a couple dots. I crank the power back to the 10 o'clock setting and the ALC comes back up and shows full deflection with the steady tone and on voice peaks.
> > > > > > >
> > > > > > > This is true on all bands, into the antenna, or into a dummy load. ALC or PWR does not fluctuate. Even with a steady 1kHz tine injected, as I increase PWR, the ALC smoothly decreases in inverse proportion.
> > > > > > >
> > > > > > > The problem is that it makes mic gain adjustment via the ALC impossible. Even with the mic gain all the way full at 5 o'clock and clearly overdriving, I barely see any ALC deflection. So at normal full PWR output, I simply rely on the power meter and reduce mic gain until I am only seeing about 75% of max AVG power, like I would on a rig without an ALC meter. I don't distort, get good audio reports, so I don't worry about it in normal operation.
> > > > > > >
> > > > > > > But I know I am missing something here theory-wise, and if I understood what was going on, I'm sure I could be a better operator.
> > > > > > >
> > > > > > > So I guess my question is, help me understand why ALC deflection goes down to practically nothing at full PWR even with mic gain cranked all the way up. And why

it goes up to max deflection when PWR is cranked back to 10 o'clock.

From: bswadener
Topic: 10940 Message: 10980

Hi Tom,

The "IF OUT1" signal is very low... only a few mV. It comes off the "NB Mixer", which taps the signal path ahead of the roofing filter (that's why you can see more than about +/- 20 KHz). 73.05 MHz 1st IF signal is mixed with 64.22 MHz LO to produce 8.83 MHz that goes to the noise blanker and IF OUT1 jack. If the noise blanker isn't working, the problem isn't a bad jack.

On the RF Unit (X44-3120-00), page 121 in the service manual, signal is tapped between L59 & L60 and coupled thru C134 (5pF) to emitter follower Q14 (2SC2714Y). Q15 (3SK1331M) mixes it down to 8.83 and outputs it through L64, C150, and L65 to connectors CN26 and CN7. One of these connectors feeds the "IF OUT1" jack.

I use my TS-850 with a Heathkit SB-620 'Scanalyzer' (and a whole bunch of gain). I'll wait for someone to ask how that can _possibly_ work. ;)

Topic: 10982 Message: 10982

Everyone has posted good stuff here, bad for the radio but good info to help someone else so I will post my horror story so it may help someone else.

My ts 850 went deaf no Transmit and UL Issues all of a sudden. It was working one minute and the next it wasnt. Here is what I discovered -

ONE BIG Problem i caught of the top after looking at pictures and reading ever single 850 post I could find is with the electrolytic capacitors on the carrier oscillator board. They leaked Everywhere!!! ... and because they leaked on the DDS chips, I am assuming it caused the radio to go deaf, and refuse to transmit AND cause the UL code to be sent. IF YOU HAVE OLD CAPS witht he BLUE across em, CHANGE EM, THEY WILL LEAK!!!!!

I took a cleaning cloth and the tip of a paint brush and cleaned off the black nasty electrolyte they leaked. The first cleaning got the audio back and it would TX, but the audio was totally off freq sounding. I cleaned them some more and got that gook off the DDS chips and i finally got the rig hearing on freq and working as it should.

The good thing is the caps didn't corrode the PCB board which is good but I am sure they are starting to loose capacitance and the board is going to eventually fail for good. All of em are set to be replaced. Originally based on the serial number of the radio I had 6631 DDS chips. Kenwood replaced them with 66312 chips some years ago I know, however the caps are are now leaking on the connections so I am hoping they will be OK.

As of right now as I pen this email I am on the AIR!!! actually putting RF out and everything shows good. I have so many good compliments on my audio and she looks good. I know this will not be the same ending for other but at least you have a start. Clif is getting my rig in the next few days but if you dont want to change the caps. get a spare card ... You;ll need it.

10983. TS-850 SAT Opening Transmitter for expanded 40m in IARU Region 1

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-01-03 15:37:58 UTC
From: Jim
Topic: 10983 Message: 10983

Friends

I own and operate a UK [IARU Region 1] TS-850. I have not undertaken the "clip diode D11" modification due to concerns that this would greatly increase the risk of operating out-of-band. I earlier queried the group if there were a way to convert a IARU Reg1 model 850 into a IARU Reg2 [US] model thereby gaining transmission coverage for 7.1 to 7.2 mhz with limited risk of not-permitted transmission. At that time, I was not able to identify a solution.

My research has now led me to information that this form of conversion is possible. Basically the rig has a set of four diode locations, D8, D9, D10 & D12, which determine each unit's basic operating parameters including TX frequencies for amateur radio coverage.

An IARU Reg1/UK rig should only have diodes D8 and D9 in place. Removing them will make the rig think it's an IARU Reg2 i.e. US version. Its TX coverage on 20 metres and above would remain identical ☐ 160m/Top Band will expand fractionally to include 1.80-2.00MHz, 80 metres will expand to 3.5-4.0MHz and 40 metres will expand to 7.0-7.3MHz. The risk of out-of-band operation in IARU Reg1 remains, but slightly mitigated to exposure in a limited range.

This is an alternative approach to cutting D11 in order to achieve full General Coverage TX across the MF and HF capabilities of the TS-850. And the D11 mod will allow 60m band transmission if that is desired.

Hope this may be of interest to the Group.
Best regards for 2012

Just curious, you made no mention of 60 meters, does that mean clipping d11 is the only way to have that band for transmit? Not that is legal in Canada (yet)

From: bswadener
Topic: 10940 Message: 10986

The input amplifier of the SB620 can be switched to operate as a mixer. Only the output of this stage is tuned (3.395 MHz). Then, all you need to make it work with 8.830 MHz is 3.395 + 8.830 = 12.225 MHz. A heterodyne oscillator at/near 12.225 MHz is needed.

I had some olde 2m crystals available. I selected one marked "146.76T Icom", which has a fundamental frequency of 146.76 / 12 = 12.230 MHz. This was close enough, requiring only a /slight/ adjustment of the sweep oscillator in the SB620. I built the oscillator dead-bug style and plugged it into the back of the SB-620.

At the time, I was using a TS-120S (and then TS-130S). There's no IF output but I provided one, with a lightly coupled 2N2222 buffer amplifier for some 16 dB gain. To use the SB620 with the TS850, I needed a bunch more gain. Just over 40dB gain using some MMIC amplifiers was barely enough. I have a design ready, using a couple of Analog Devices AD603 wideband/low noise VCAs.

It's not LP Pan but, it's stand-alone, and works.

Dave,

I did mention the same in the very last paragraph. Just a small recap.

The rig was designed before 60m was a Ham Band. Therefore, 60m was not included in the hard coding for amateur band transmission in any version. Performing the D8-9 mod on an IARU Reg 1 rig [or presumably any other factory set up, for that matter] will not allow access to 60m.

If you want 60m, the D11 mod is the only way to it and this blows the rig wide open, so to speak. Just what I did not want.

Cheers
Jim

From: Kurt Cathcart
Topic: 3179 Message: 10989

I just picked up a DSP-100 and I'm having a few problems that maybe you all can help me out with.

The unit came to me reeking of cigarettes so I'm inclined to think that this may be part of my problems.

1. The audio seems to drop out at times. If I power cycle the unit is seems to fix the problem most of the time. Sometimes if I hit the receive button this might correct the problem also. Re-seating the RCA cables seems to be more reliable. Maybe I need to clean the connectors of cigarette residue?

2. The filter switches don't seem to make any difference. I suspect the 6 pin cable to the TS-850. The cable that I have is labeled a crossover cable. I checked it out and pins 2,3 and 4,5 are indeed crossed over. Looking at the TS-850 manual it looks like the crossover cable is used for connecting two radios together. Would this be the correct cable for just connecting one radio?

3. Do I lose CAT capability with the DSP-100 hooked up? If not, how to I cable the computer to the radio/DSP?

Keon ,
And to anyone else .
I would suggest that if you have any of these leaky caps , you should not even have the rig plugged in , let alone use it .
My reasoning is that the leaky caps will eat away at the traces and also make electrical connections where you do not want them and possibly killing the " non-replaceable " DDS chips .
If you can not for what ever reason get these caps replaced , putting power to the radio will accelerate the leaking .
Once the leaking creates a electrical path to any number of places it shouldn't be , you run a very high chance of having a parts rig .
I got my rig from an estate just in time , got home saw that all the caps on the CAR board were leaking and I replaced all , now I am on the look out for a second TS-850 , because I really like this radio and all the good audio reports .

Hi Kurt and all others to the group.
First of all a superb 2012 for everyone!

I had a DSP-100 too, and one of the problems was the main connectors on the print had to be re-soldered within months.
It is a very bad solution from Kenwood for having the connectors directly mount on the pcb.
Second, the audio cables with the cinch connectors have to be crossed! (the left one on the rig leads to the right one on the dsp-100)
I also had to re-solder the 13-pin cables because of some wire-breaking. (I bought mine second hand too, and think the formerly-owner did put the unit firmly backwards against the wall or something).

I did use a homemade cat controller by some italian design, and it never did work after the dsp-100 was connected, so the dsp went in a box.
Probably because of putting the dsp 100 in series, the TTL signal drops below 5 volts and isn?t recognised by the cat controller anymore.
Maybe with the original Kenwood controller it will work ok....

As far as I know the 13-lead cable (at least one I?m sure of!) was labelled as crossed.

All the things you have written sounds very familiar to me, and I did solve them all (except the cat-thing) by adjusting the switches and knobs on the DSP.
I hope this was a little bit of help.

John its offline and in the process of ordering new caps. The guy that sold it to me feels bad because he did not know that there is leaking but it's a situation where he just didn't know. I knew the risk when I bought it in the radio is an absolutely perfect condition with the exception of the leak in caps. A few years ago probably about 7 or 8 he had the dds chips replace buy kenwood so why the rascals didn't just go ahead and replace to caps I don't know. I'm hopin that I got to the situation in time, the radiohead been setting not in operation for over 2 years so it appears that after I wiped out all gook it started to work so I'm hoping that is just a matter of cleaning the car bored really really good and replacing those caps and I should be good to go. The fact that I was able to hear real audio on the lsb and it sounded like people actually talking is a good start.

Also I hear that a lot of people are saying just replace the 1 or 2 that start to leak and I think that that is the dumbest idea in the world, replace them all!

I am not point pointing this just at you , this is a mail reflector with many reading , so its to all that want to save there rig .
The cleaning is much more involved then you mention , wiping off the surface .
The corrosive chemicals get under the coating on the board , wiping off the surface does not remove all the corrosive chemicals .
The protective coating over the trace needs to be removed and then the corrosive needs to be neutralized , then recoated , then replace the caps , the recoating needs to be there before recapping .
I have some pictures of fixing my rig , the problem being I use my Iphone and the pictures are as good as I would haved liked and then was in a hurry and did not get pictures of the finished repair .

WHAT ARE WE TALKING ABOUT?

All the PCBs I have had from commercial PCB manufacturers have had this done before they were coated.

I'm a retired EE with 40+ years in the electronic manufacturing industry.

Stripping the coating of the PCBs is not a smart thing to do. It will just lead to more problems.

Don't use ACID CORE solder when you make repairs. Don't use the new EVIORMENTALLY FRIENDLY solder. Use good rosin core solder. Clean the joint with either acetone or lacquer thinner. Fingernail polish remover will also work.

If you want you can coat the new joint with clear fingernail polish.

I was using kmij occasionally, but not sure if windsow 7 would allow it to work.. did you install in program files folder or root of c???

In the meantime I will check mine again against the usb to serial adapter I am using.

Just check software is NOT compatable with 64 bit wind 7

NEVER had an issue with HRD, even on win 7...

Again try installing in root of c, there is no user control there

Subject: [TS-850_450_690] KMIJ Kenwood Remote Control for TS-850

has or is there anyone that has heard or is using this program? I have the interface if-232c hooked up to my laptop with vista. When using hrd at more times than not it locks up and dumps the program and reboots.
thanks in advance I hope
George

I couldn't pass up on a TS-850 that was struck by lightening.
Looking for some decent leads on where to start.
Everything still powers up, all controls at least seem to function.
RX is all but almost dead, only the strongest of signals can be heard.
TX also appears to be dead, ptt does swtich it over and current draw does pick up However its not much.

Is there a typical list of things that I should start with?

Thanks in advance.

See if there are some protection diodes in the antenna circuit. Is there an autotuner. If so bypass it.

Find the receiver's RF amplifier. connect an antenna directly to it.

Start at the antenna and inspect visually. The picture on the home page for this group is of the gas discharge tube used as a protective device which specifically is intended to help protect these radios against excessive power coming back into the antenna connector. It (the gas discharge tube in the picture) has been blown. The radio will work with it out of the circuit, but if shorted or leaking, it will greatly reduce receive sensitivity and also can short circuit the output from the transmit side.

Maybe this helps.

The electronic technician approach might be to start at the back end, and use a signal injector to ensure that audio, then if, mixers, then rf stages work as intended.

Start by looking at that gas discharge tube and the stuff right around it physically and electrically.

Bypassed the antenna change over unit took coax from CN6 direct to antenna and reception is back.. inspected visually appears someone switched out the gas tube with some other surge protector? and a few inductors look like they were used as space heating elements..
So took it out and flipped it over.. and it was burnt right through the PCB and left a nice black mark on the chasis.
So will need a new one of those boards.

Now I assume the relay on this board controls the actual TX circuit so the fact I had no real TX could simply be a result of the burnt out hole under the relay,thefore not tripping the finals? Or is it the other way around the realy trips upon detection of the RF out of the finals? sighting I still have further issues?
Thanks

I have fixed my problems.

One of the RCA connectors was broken off of the PC board.
I had to reset the dip switches.
I had to clean the nicotine out of the connectors and switches.

All seems to work fine now. Thanks for all your help.

Not sure why you need to convert a prolific adapter. Go to there website and make sure you have the most up-to-date driver for your OS.

Also can you tell why it is crashing. Is it maybe the security on vista stopping it?? I am using windows 7, and have had no problem using a prolific usb device on my 850, BUT I do not have the software installed in program files folders

11007. Kenwood TS-450S Internal ATU Problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-01-11 01:43:44 UTC
From: Ron Polityka
Topic: 11007 Message: 11007

Hello,

I have a problem with my TS-450S ATU.

The Internal ATU will not tune. I took the cover off to see what is going on. When looking from the front of the rig the left gear is oscillating back and forth. Will not stop.

The gear is not slipping and I do have the Channel 31 On in the memory.

The audio does cut out when it tries to tune with the RF.

Thanks in advance for any help.

Look at the cap itself and make sure it's moving, both of them.

I don't know if this is the same issue I had, but if you do not have the Carrier level high enough the tuner will not tune, but oscillate back and forth as you describe. Once you turn up the carrier level you should find it will tune properly.

I had the same issue with my TS-850 but once I turned up the carrier level the ATU unit worked properly.

Hi Rick,

Thank you for the information.

Unfortunately it does not make any difference where the ALC
is set.

Could be a bad relay.

If anyone had a bad relay, what did you do?

Uh, replace the bad relay. If that is the case it would work on some bands and not on others. What bands does it work on and what not. Into a dummy load, not an antenna.

Hi Clif,

It does the same thing on a dummy load or antenna. Works on
80m and 10m. All other bands it just oscillates.

Caps leaked on CAR board. Cost depends and I understand cause it just
happened to me.

Cost depends on the amount of damage to the board. Talk to Clif from avvid.
Very reasonable to talk to and honest.

Hi Clif,

Looking down at the ATU the left cap is tuning but the
right does not move.

11019. Memory Battery ??

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-01-17 17:27:14 UTC
From: Joe Cotignola
Topic: 11019 Message: 11019

Hi all...new to the group.
I have an 850s that I have just replaced the memory backup battery on the curcuit board with an external 3V cell in a holder.

In testing the memory channels, I found that even though the battery is now a good 3V, the radio seems not to keep the memories when I turn the radio off.

Anyone run into a similar symptom ?

Thanks in advance
73 Joe WR2B

Hi CLif - I was pretty deliberate about the install - looking at the circuit board, the PLUS of the battery goes on the top (1 pin) and the bottom is Negative (2 pins).

Yes ??

Thanks

That's backwards. The single pin is negative.

Thanks a bunch Clif..that was it. When I opened my 850 I found that there was no battery there at all, I found a repalcement How-To on the web and it said the top(single) pin was positive, so I wired it that way.
Luckily I mounted the coin cell holder on a small board and just turned the battery over so that the polarity is reversed.
All works fine now...

Have to ask what kind of noise? Impulse, atmospheric, white, adjacent channel, heterodyne, etc?

If it is pulse or impulse type noise, the usual TS-850 noise blanker is not very effective, due to a circuit change from the version in some older Kenwood radios. There is a simple mod on the mods lists which changes the circuit back to the previous design, by removing two capacitors and suddenly it is supposed to work much better. (I have to say that because I live out in the country and have only tried the noise blanker once or twice and I hadn't really needed it then.

It looks to me that the SCAF-1 is an audio output filter.

I am using a TimeWave ANC-4 Antenna Noise Canceller to get rid of the crap before it gets into the receiver.

From: w8nf
Topic: 11026 Message: 11030

The audio demo files on Idiom Press's website were made by me, using my TS-850SAT, played through an early version of the SCAF filter. Since that time, a circuit change to the SCAF has reduced the hiss level that it generates.

The SCAF is just a variable lowpass filter. If you have a lot of impulse noise, it won't knock it out, but it can make it somewhat less offensive. I use high-efficiency headphones with my TS-850SAT and find the high frequency hiss objectionable, even if I crank down the "tone" control on the front panel. The SCAF takes care of that hiss.

In fringe cases, the SCAF can act like another set of poles on top of however many poles you have in the two IF stages...but that's a pretty darned fringe case when you'd find that useful.

For impulse noise, the TS-850SAT's built-in noise blanker is a better tool than anything outboard.

11032. Using a Heathkit QF-1 Q-Multiplier w/the TS-450

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-01-26 02:39:46 UTC
From: Ron
Topic: 11032 Message: 11032

I recently acquired a QF-1 Q-Multiplier for chump-change.

It occurred to me that because the QF-1 operates at 455kc I should be able to substitute it for a DSP-100.
Which rear panel jack(s) will give me access to the 455 I.F.?

Also, down the road I am considering replacing the 12AX7 in the QF-1 with a pair of transistors. Does anyone have any ideas on what transistors would give an equivalent gain?

Curiously,
Ron

Neither. DSP1 is an input for the TX albeit at 455 kHz. DSP2 is raw audio level out to the DSP.

The DSP100 on the rx side operates at audio frequencies. The Tx side generates SSB and CW and is input at 455 kHz.

Thank You Cliff.
Somehow I thot that the DSP-100 was an IF DSP (on receive).
Guess I was wrong.
In looking at the schematic, I see that you are correct about DSP1 & DSP2. So, that raises the question - where is the best point to tap the IF output for a QF-1 connection?

Curiously,

Dennis ... that's not a fair statement. The EQ doesn't make bad operators ... I'm not a BAD operator and my sign doesn't splatter. However the eq is like a Taylor of fine clothes, it fits you better and you look and feel better. Who doesn't want to taylor your audio for definition, rolling of lows and boosting the range of human voice. Thats perfectly acceptable and helps not splatter. Anytime you wanna hear me let me know and we can meet on the air for a test and you tell me.

Btw the hand mic sucks with men that have real heavy voices. It boosts highs and doesnt roll of any decent lows. This is why I roll off everything under 250Hz.

I don't see how an equalizer can broaden your signal. That's done in the transmitter. However the EQ can boost and enhance the low frequencies of a voice that may become more problematic for real close in stations on LSB.

It takes high level high frequency energy to broaden a signal.

This can happen if the audio stages are driven into a level where clipping occurs.

A square wave has infinite odd harmonics.

Actually I have seen issues where people have used eq's and on top of it crank the processor up and cause the signal to splatter. Eq By itself has never been a problem.

11043. Re: KMIJ Kenwood Remote Control for TS-850

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-01-28 17:29:38 UTC
From: ve3mij
Topic: 10985 Message: 11043

I've never tried it on 64 bit windows, but it works on all the others...

Just getting back in the hobby and dragged out KMIJ to see how it does on Win 7 and it works fine. The version posted on here is the latest. Development stopped when my daughter was born, 16 years ago!

If you run in to a problem with it loading, then delete the .ini file as it will write a new one if it sees none.

The program was written in Visual Basic version 1, originally, which had no support for com ports, so I had to figure out how to call those functions, like a C program would. Good thing, as it allows it to function, 20 years later.

I would not be surprised if it doesn't run in Win64. I am surprised that it still runs in Windows at all!

If it's crashing, it's something else crashing it. If everything is running fine, it runs fine.

I noticed LPB2 will crash it if I pull up the S-Meter. Otherwise it works fine with that and I run it along with PowerSDR IF through LPB2 and it's all good.

11045. TS-850 Frequency Reference

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-01-30 05:07:36 UTC
From: bswadener
Topic: 11045 Message: 11045

Hi Folks,

I have a TS850SAT that is not on frequency - at 28MHz, it's off about over 330 Hz. Yeah, I could just tweak it on-frequency but, if/when the temperature in the shack changes, it'll be off again. I could pony-up close to $200 for the Kenwood SO-2 TCXO but IMO, they're WAY too "proud" of it, and it's still just a TCXO. I tried to find an off-the-shelf TCXO but 20 MHz is an uncommon frequency. There are other methods (N3BA TCXO, the Kuhne crystal heater, and KC5KCW's novel crystal heater using a PTC thermistor) but I wanted BETTER stability.

Whilst perusing eBay, I found a UK chap selling an interface board that fits where the SO-2 fits, and lets you feed it 10 MHz. Additionally, if it doesn't see 10 MHz coming in, it defaults to the OEM 20 MHz rock. WAY cool! Look for item #120846302925. Cost: about $70 w/ shipping.

I also purchased a 10 MHz rubidium frequency standard, from one of the many vendors in China. The units are pn FE-5680A, made by "Frequency Electronics (http://www.freqelec.com/rb_osc_fe5680a.html), and appear to be widely available. User "nichegeek" (item #270873476863) appeared to be the best deal, and the seller has 100% feedback and has sold several dozens of that unit. Cost: about $45 w/ shipping.

Film at 11:00!

I need to fit an external microphone amplifier and compressor to my TS850. Where shall I connect it at the rear ? Do I need to set the software ?

Also, I do not have the DSP100, but I have heard, that I can still improve the audio quality of my transmission by adjusting the 8mhz tx filter to 6 khz. Can I do this, without upsetting the other settings ?

I am an ex sound engineer, and I am not happy with the ssb I hear on the air ! Unfortunately, manufacturers, homebrewers and authors tend to neglect the audio chain in transcievers.

No I am not happy with the mic & processor of the TS850, it certainly can be improved. The weakest link in the chain is the mic ! You must have a mic with a response, well above the traditional 2.5 or 3Khz bandwidth !

I am also an ex sound engineer, and I would like to take a moment to remind you that the microphones supplied with 98% of the radios are more than adequate for the job hey need to do.

These are NOT broadcast radios, requiring 20 to 20,000 Khz for music and entertainment - these are communication radios that need to carry the intelligible spectrum of the human voice, in the least bandwidth possible (so there is room for the others on that segment of the band)... that means frequency range of from ~300 to 2,800 Hz - and I have yet to see a microphone that would not meet those specs - the limits on transmitted bandwidth are in the radio itself, and if you remove those filters, you will eat up a huge portion of bandwidth to no avail, because the receivers on the other side of the conversation won't hear your melodious tone, because their receivers cant hear more than ~2,700 to 3,000 Khz.

Don't discount how a certain mike would dynamically respond in the 300 - 2800 Hz range. There is a HUGE difference in how mics respond dynamically and this translates to how a mic sounds. Mics with cheaper cartridge's sound cheap even though they work in the same frequency range as the more expensive mics. You must also consider the "tone stack" in the radio. Meaning, how the radio shapes the frequency response once the signal enters the radio from the mic.

Kurt you are absolutely 100% correct. You cant get a good response out of a mic that is it not carfully constructed in any freq range. Cheap mics boost areas that are actually detrimental to the sound quality, especially in the 500 to 700Hz range where the sound could actually be rolled off.

This is why Heil charges so much for a mic, because of the time it takes to get that human voice range as clear and solid as possible. I pref to talk on condensers because of that clarity AND flat response so I can taylor my voice with an EQ. Trust me its heard on the other side. You can pick out those who are on cheap mics vs. someone who spent time picking a mic that is right for them. (If you have the ear of course.)

Forget the theory for a while! Let?s be practical!

We often hear a pileup trying to work an elusive dx station. You can hear scores of very distorted low frequency voices, with lack of tops !
Out of the blues, comes a rich, well equalized voice, with no compression, no punch, just a clear , understandably almost hi-fi, nearly pro vocal !
And he get an answer from the dx station, even thou, the others were probably an S9 or so !!!!
Why do you think some hams prefer a mic from another? The difference is in the response. So to hell with the theory of 3Khz bandwidth!

Try fitting a professional 30Hz to 20Khz condenser microphone, instead of the so called ssb mics, and you will hear the difference! 3Khz or not, the difference will be there, and very very noticeable, because we are talking in practice not theory !!! If your aim at a final result of 3Khz, then you should start your design for 6Khz or more. to compensate !! If you design for 3Khz, with all the filters, circuit losses etc, you finish up with 2 or even less Khz !!!

The TS850 has a variable IF bandwidth from 12Khz down to 100hz (with optional filter). Today's ham bands are not so crowded, as used to be (except in an annoying contest) so opening the bandwidth is not going to harm anyone. Sometimes, closing the bandwidth causes a peak in the noise! ot to mention the noise caused by the insertion of the carrier to read ssb !

I intend to set up my TS850 with a Neuman, Sennheiser or AKG professional condenser mic, feeding a THAT1570 mic amp chip, with almost unmeasurable distortion and noise. The main problem is how to

I was not talking theory - I am talking practical reality - I have been a ham for over 50 years and cracked hundreds and hundreds of pile-ups on very rare countries - (and missed my share too).

Your theory of "Out of the blue, comes a rich, well vocalized voice, with no compression no punch, just a clear , understandably almost hi-fi, nearly pro vocal! And he get an answer from the dx station, even thou, the others were probably an S9 or so !!!!"... it pure unadulterated BS.

It is obvious that you have not spend much time actually working DX in DX pile-ups.

1 - The human voice (particularly the male voice) has most of it's energy in the low end, below 300 cps. If you put the male voice in a spectrum analyzer, you will find that the 100% levels will be determined by the frequencies below 300 cycles - reading up the frequency scale, the higher frequencies that carry information will show peaks in the 8% to 12% levels.

Since the output level of a transmitter is determined by the largest peak, in an unmodified voice, the lowest frequency peaks will set the max output (most likely 100 watts) and the information part of the voice will be at ~8 to ~12 watts. A very poor communications signal.

If you remove the bottom 500 cps, the peak output will now be determined by the frequencies that were 8% to 12% - so you just got a free 8 to 10 db gain in your understandability.

The modern mics that come with our transceivers are well designed - the Kenwood MC-90 puts out a voice signal to 20,0000 cycles that is fairly flat, with 10db low frequency cut-off below 200 cycles- how much higher do you need to go??

While studio mics are "Flat" across the spectrum, because they need to reproduce the voice of every performer so they sound the same in every studio, the communication mic has a different job - it is to get as much understandability as possible, with the limited power available, under the worst atmospheric conditions.

The "Hi Fi" mic fails badly in this roll.

This not "my opinion" it is the result of millions of hours of hams working across vast distances, under the worst conditions possible.

I have used a bunch of mics, including Kenwood MC-60, and MC-90, Yaesu, Icom, and Heil... and currently have a top of the line Heil on a boom.

The very best signal reports I have ever consistently received were from
a D-104 with a crystal head - the base amplifier was removed, and the
mic was feed directly into a TS-940 through a home made 600 ohm "T-pad"
with an adjustable bridge. I have yet to find another mic as good as that.

By the way, Malti...

.. what is your call sign? And how many years have you been "On the
air", as a ham??

Hello to you all.

I am new to this user group

Need to know what years the TS850 was built/sold.

I understand they came out in 1991, but not sure how long they were made.

Hard to find this info on web.

Thanks, Bruce N4JHY

11062. Re: [TS-850_450_690] Need TS850 info please

I think it was 1990 to 1996. I believe this was discussed previously on this group. You could do a search on previous messages.

I slightly disagree with one thing. The Studio condenser that I run is MXL 990 that I pulled out of my studio upstairs. I run condensers not because they are the same in every studio but because the flat response allows for the best in tailoring the audio reproduced.

You want that on a 850 or any other rig that has the ability to EQ a signal. IF you don't have that ability, then a GOOD dynamic mic like the Sennheiser s835 that will give you minimal boost in the human voice range with a smoother response than HEIL produces.

HEIL does a great job on boosting the vocal range however its not always beneficial. DX is going to hear flat smooth audio faster than peaked Highs in the Audio ... and I work piles ups every single day and break them 85% of the time.

Now, we can argue this point and agree to disagree but the bottom line is you do what works, to get the DX and that we can all agree is the common goal.

Keon KE3HAY

I was not talking theory - I am talking practical reality - I have been a ham for over 50 years and cracked hundreds and hundreds of pile-ups on very rare countries - (and missed my share too).

Your theory of "Out of the blue, comes a rich, well vocalized voice, with no compression no punch, just a clear , understandably almost hi-fi, nearly pro vocal! And he get an answer from the dx station, even thou, the others were probably an S9 or so !!!!"... it pure unadulterated BS.

It is obvious that you have not spend much time actually working DX in DX pile-ups.

1 - The human voice (particularly the male voice) has most of it's energy in the low end, below 300 cps. If you put the male voice in a spectrum analyzer, you will find that the 100% levels will be determined by the frequencies below 300 cycles - reading up the frequency scale, the higher frequencies that carry information will show peaks in the 8% to 12% levels.

Since the output level of a transmitter is determined by the largest peak, in an unmodified voice, the lowest frequency peaks will set the max output (most likely 100 watts) and the information part of the voice will be at ~8 to ~12 watts. A very poor communications signal.

If you remove the bottom 500 cps, the peak output will now be determined by the frequencies that were 8% to 12% - so you just got a free 8 to 10 db gain in your understandability.

The modern mics that come with our transceivers are well designed - the Kenwood MC-90 puts out a voice signal to 20,0000 cycles that is fairly flat, with 10db low frequency cut-off below 200 cycles- how much higher do you need to go??

While studio mics are "Flat" across the spectrum, because they need to reproduce the voice of every performer so they sound the same in every studio, the communication mic has a different job - it is to get as much understandability as possible, with the limited power available, under the worst atmospheric conditions.

The "Hi Fi" mic fails badly in this roll.

This not "my opinion" it is the result of millions of hours of hams working across vast distances, under the worst conditions possible.

I have used a bunch of mics, including Kenwood MC-60, and MC-90, Yaesu, Icom, and Heil... and currently have a top of the line Heil on a boom.

The very best signal reports I have ever consistently received were from a D-104 with a crystal head - the base amplifier was removed, and the mic was feed directly into a TS-940 through a home made 600 ohm "T-pad" with an adjustable bridge. I have yet to find another mic as good as that.

11064. A new mic amp for the TS850 & essb

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-02-06 07:31:05 UTC
From: pauldebono@rocketmail.com
Topic: 11049 Message: 11064

In a professional recording studio, we use different microphones for different instruments, and even different vocals !. There are the unidirectional, cardoid, hypercardoid etc. So it is not just picking up any full range pro mic, but the right mic for the right sound ! Microphones intended for speech are advertised as "vocals" And these types are suitable for us. Despite their 20 to 20Khz response, they have a peak at the vocal frequencies, and with all probability, you do not even need an EQ. Some, like the AKG D109, have a built-in cut off of the very low frequencies. Others have a built-in boost for the tops !

For those who asked, I am an ex-sound technician, ex- motion picture sound engineer, ex-sound balancing engineer, ex- Marine Radio Officer, ex- Marine radio coast station operator, ex- servicing technician, Licenced ham 1964.

Topic: 11066 Message: 11070

Kurt ill get on your rescue boat and grab the other oar.

Folks who claim this isn't about the radio need to read from the Top of the thread ...

Adding to all this thread, yesterday I used a Heil goldline element on the air and to me it distorted the characteristics of my voice on the air. Off the bat I noticed you had way too much bass. The recording that I got back from a friend in connecticut was not what I expected to hear on the other side. I've been switched over to the g m 5 elements in what I heard was a closer representation of my voice however it made me sound tinny.

Now I am not sure if there is audio adjustment somewhere in the hidden menus of the ts 850 however when I put the sennheiser microphone on (e835) what I got was a much smoother audio, much more pleasing audio an a true representation of what I actually sound like in a face to face conversation.

I still would like to have an eq in line to roll of a little bit more of the low end and maybe add some sparkle boosting the 12 13 and 15 kH.

In my opinion you're going to get the best audio from a microphone that is going to give you the flatest response possible without rolling off too much on the bottom without adding too much at the top and you setting up an equalizer in between the radio and the microphone to buy just for clarity, presents, and the brilliance of how you actually sound.

I'm also gonna stand firm in saying that the compression the radio offers is okay but it is always going to be better even to have an external compressor in line before getting to the radio and using that vs the processor it it comes with the radio.

To recapitulate everything that has been stated:

1. Everybody can agree that's what gets them the dx works for them.

2. Everybody is not going to agree with the choice of microphone

3. There are more than enough opinions, theories, and practical examples on this thread that people who are looking for a solution can try and see what works for them.

4. I think everybody can agree that eqing does not cause splattering, bad operating habbits do

5. All of our Kenwood radios are the best radios ever made on the planet!

Kurt ill get on your rescue boat and grab the other oar.
Folks who claim this isn't about the radio need to read from the Top of the
hread ...
Adding to all this thread, yesterday I used a Heil goldline element on the
ir and to me it distorted the characteristics of my voice on the air. Off
he bat I noticed you had way too much bass. The recording that I got back
rom a friend in connecticut was not what I expected to hear on the other
ide. I've been switched over to the g m 5 elements in what I heard was a
loser representation of my voice however it made me sound tinny.
Now I am not sure if there is audio adjustment somewhere in the hidden
enus of the ts 850 however when I put the sennheiser microphone on (e835)
hat I got was a much smoother audio, much more pleasing audio an a true
epresentation of what I actually sound like in a face to face
onversation.
I still would like to have an eq in line to roll of a little bit more of
he low end and maybe add some sparkle boosting the 12 13 and 15 kH.
In my opinion you're going to get the best audio from a microphone that is
oing to give you the flatest response possible without rolling off too
uch on the bottom without adding too much at the top and you setting up an
qualizer in between the radio and the microphone to buy just for clarity,
resents, and the brilliance of how you actually sound.
I'm also gonna stand firm in saying that the compression the radio offers
s okay but it is always going to be better even to have an external
ompressor in line before getting to the radio and using that vs the
rocessor it it comes with the radio.
To recapitulate everything that has been stated:
1. Everybody can agree that's what gets them the dx works for them.
2. Everybody is not going to agree with the choice of microphone
3. There are more than enough opinions, theories, and practical examples on
his thread that people who are looking for a solution can try and see what
orks for them.
4. I think everybody can agree that eqing does not cause splattering, bad
perating habbits do
5. All of our Kenwood radios are the best radios ever made on the planet!

I don't know what radio you are referring to.

But, for communications quality voice what is needed is simply a clipper/filter system.

By clipping the voice peaks you can generate a stronger voice signal without over driving the amplifier. The filter is there just to remove the excess harmonics created by clipping.

I first saw this technique use in the 50's when AM was the predominant mode for voice.

If you want HiFi that is a different problem.

I purchased a TS-850 Friday, and I am in love.It does everything I want, and when I want it to. Great audio reports over the weekend on SSB.
Trying to line up a DSP-100, but from what I've seen on pricing, it would cost me as much as I paid for the radio.
The great audio reports were with the stock hand microphone. I will be trying some front end processing as soon as I make an 8 pin cable. I've had pretty good results with an old audio technica ST90 microphone. It seems to match my voice pretty well.
One question though, without the DSP-100, the radio is limited on SSB to 2.7khz on the transmit, correct?

Bob

In theory that is exactly what compression does. It takes the peeks, compresses them down and what you get is the meat of the audio suppressing the harmonics.

The processor or the compressor on the ts 850 is a marginal at best when you are truly trying to get the effects of compression.

The processor on the radio is trying to imitate a compressor which takes the most signal in the smallest bandwith thus making your signal louder and punchy. That is the point of it but that doesn't necessarily mean that it improves anything. My point is with that radio it is better to run an external compressor than to use the radio built in processor because the external compressor is gonna do a much better job because that is what is designed to do - not 900 other different things.

I am just getting familiar wit the Kenwood HF radios. Some seem to have TOO MANY features!

There is nothing new about speech compression. Just how it is generated.

I have a TS-520 which does not have any of this stuff. So an external box would be required.

People should know that a speech compressor can be more cost effective than adding a linear amplifier. A 25W SSB transmitter can be made to sound like a 100W SSB transmitter. It's done by just increasing the average power level.

IN deed. Then you would run into guys that have too much compression and
then you would rather them have 1.5KW than a compressor.

Subject: Re: [TS-850_450_690] Re: Mic Stuff

I am just getting familiar wit the Kenwood HF radios. Some seem to have TOO
MANY features!

There is nothing new about speech compression. Just how it is generated.

I have a TS-520 which does not have any of this stuff. So an external box
would be required.

People should know that a speech compressor can be more cost effective than
adding a linear amplifier. A 25W SSB transmitter can be made to sound like a

100W SSB transmitter. It's done by just increasing the average power level.

I would love to get with 2 or three folks and organize a net with all of these Kenwood 850s and 440's --- just to hear all these radios on the air would be lovely. Has anyone ever considered it? I was thinking One Monday evening about 8:00 on 75M? It could be a one time event as far as I am concerned I just want to hear some of these stations on the air.

Subject: RE: [TS-850_450_690] Re: Mic Stuff

I purchased a TS-850 Friday, and I am in love.It does everything I want, and when I want it to. Great audio reports over the weekend on SSB.
Trying to line up a DSP-100, but from what I've seen on pricing, it would cost me as much as I paid for the radio.
The great audio reports were with the stock hand microphone. I will be trying some front end processing as soon as I make an 8 pin cable. I've had pretty good results with an old audio technica ST90 microphone. It seems to match my voice pretty well.
One question though, without the DSP-100, the radio is limited on SSB to 2.7khz on the transmit, correct?

Kurt ill get on your rescue boat and grab the other oar.

Folks who claim this isn't about the radio need to read from the Top of the

hread ...

Adding to all this thread, yesterday I used a Heil goldline element on the

ir and to me it distorted the characteristics of my voice on the air. Off

he bat I noticed you had way too much bass. The recording that I got back

rom a friend in connecticut was not what I expected to hear on the other

ide. I've been switched over to the g m 5 elements in what I heard was a

loser representation of my voice however it made me sound tinny.

Now I am not sure if there is audio adjustment somewhere in the hidden

enus of the ts 850 however when I put the sennheiser microphone on (e835)

hat I got was a much smoother audio, much more pleasing audio an a true

epresentation of what I actually sound like in a face to face

onversation.

I still would like to have an eq in line to roll of a little bit more of

he low end and maybe add some sparkle boosting the 12 13 and 15 kH.

In my opinion you're going to get the best audio from a microphone that is

oing to give you the flatest response possible without rolling off too

uch on the bottom without adding too much at the top and you setting up an

qualizer in between the radio and the microphone to buy just for clarity,

resents, and the brilliance of how you actually sound.

I'm also gonna stand firm in saying that the compression the radio offers

s okay but it is always going to be better even to have an external

ompressor in line before getting to the radio and using that vs the

rocessor it it comes with the radio.

To recapitulate everything that has been stated:

1. Everybody can agree that's what gets them the dx works for them.

2. Everybody is not going to agree with the choice of microphone

3. There are more than enough opinions, theories, and practical examples on

his thread that people who are looking for a solution can try and see what

orks for them.

4. I think everybody can agree that eqing does not cause splattering, bad

perating habbits do

5. All of our Kenwood radios are the best radios ever made on the planet!

I was just looking at the DSPs at HRO. All they have are receiver post processors.

Are there any microphone speech compressors available anywhere?

DSPs are nice since they can be reconfigured without component changes.

Both input processing (mic) and output (spkr) processing could be done in a PC.

What Kenwood radios have built in speech processing?

then you would rather them have 1.5KW than a compressor.

Subject: Re: [TS-850_450_690] Re: Mic Stuff

I am just getting familiar wit the Kenwood HF radios. Some seem to have TOO
MANY features!

There is nothing new about speech compression. Just how it is generated.

I have a TS-520 which does not have any of this stuff. So an external box
would be required.

People should know that a speech compressor can be more cost effective than
adding a linear amplifier. A 25W SSB transmitter can be made to sound like a

100W SSB transmitter. It's done by just increasing the average power level.

Would a TS-850 transmitting with a 6 or 12kc filter on ssb, actually be doing double side band, suppressed carrier?

I was just looking at the DSPs at HRO. All they have are receiver post processors.

Are there any microphone speech compressors available anywhere?

DSPs are nice since they can be reconfigured without component changes.

Both input processing (mic) and output (spkr) processing could be done in a PC.

What Kenwood radios have built in speech processing?

Subject: RE: [TS-850_450_690] Re: Mic Stuff

I purchased a TS-850 Friday, and I am in love.It does everything I want, and when I want it to. Great audio reports over the weekend on SSB.

Trying to line up a DSP-100, but from what I've seen on pricing, it would cost me as much as I paid for the radio.

The great audio reports were with the stock hand microphone. I will be trying some front end processing as soon as I make an 8 pin cable. I've had pretty good results with an old audio technica ST90 microphone. It seems to match my voice pretty well.

One question though, without the DSP-100, the radio is limited on SSB to 2.7khz on the transmit, correct?

best regards,

Greg

Kurt ill get on your rescue boat and grab the other oar.

Folks who claim this isn't about the radio need to read from the Top of the

hread ...

Adding to all this thread, yesterday I used a Heil goldline element on the

ir and to me it distorted the characteristics of my voice on the air. Off

he bat I noticed you had way too much bass. The recording that I got back

rom a friend in connecticut was not what I expected to hear on the other

ide. I've been switched over to the g m 5 elements in what I heard was a

loser representation of my voice however it made me sound tinny.

Now I am not sure if there is audio adjustment somewhere in the hidden

enus of the ts 850 however when I put the sennheiser microphone on (e835)

hat I got was a much smoother audio, much more pleasing audio an a true

epresentation of what I actually sound like in a face to face

onversation.

I still would like to have an eq in line to roll of a little bit more of

he low end and maybe add some sparkle boosting the 12 13 and 15 kH.

In my opinion you're going to get the best audio from a microphone that is

oing to give you the flatest response possible without rolling off too

uch on the bottom without adding too much at the top and you setting up an

qualizer in between the radio and the microphone to buy just for clarity,

resents, and the brilliance of how you actually sound.

I'm also gonna stand firm in saying that the compression the radio offers

s okay but it is always going to be better even to have an external

ompressor in line before getting to the radio and using that vs the

rocessor it it comes with the radio.

To recapitulate everything that has been stated:

1. Everybody can agree that's what gets them the dx works for them.

2. Everybody is not going to agree with the choice of microphone

3. There are more than enough opinions, theories, and practical examples on

his thread that people who are looking for a solution can try and see what

orks for them.

4. I think everybody can agree that eqing does not cause splattering, bad

perating habbits do

5. All of our Kenwood radios are the best radios ever made on the planet!

HI Dave

How to you have the audio going into the radio?

I think the JT-65 and hamscope use AFSK so the radio will have to be in USB, not FSK. You will need an interface between the sound card and the audio input of the radio. I was looking at the schematic on his website and there are actually 2 of them. One of them uses the serial port to key the radio and the other one uses an interface to the sound card.

You can go to this page:

http://www.search-document.com/pdf/2/8/psk-31.html

Scroll down and it shows how to make an interface. They are pretty simple, just a couple of small audio transformers and a few parts. 73
Tom W7WHY

Hello all,

I have a ts450sat and put together a sound card interface by following the k6aix instructions available on the web. PTT works fine when plugged into the db9 port behind the desktop computer, not at all using the converter cable. I have tried setting port speeds to 4800/8/2/n etc.
The part# of the converter is ftdi UC232R-10. I gotta be missing something here. Tried on laptop, same deal. JT65-HF and hamscope, same deal. Any ideas are very much appreciated.

Thanks for listening,

Dave

Hi Tom,

Thanks for the quick response. The audio is fed through the box from pin 3 of the 13 pos din to the mic in on computer. Audio from the computer is going through the box to pin 11 on din. PTT is going from pin 7 (rts) and pin 5 (gnd) on db9. all works fine except when I try to use the usb to serial converter.

Thanks again,

Dave

Hi Dave and all others,

Don't bother about the homemade hardware, it works.
Problem in most circumstances is software.
For instance... you are sure knowing what (virtual) comport your ftdi chipset is generating? I assume that it is also set in your program?
Sometimes you have to search for better/different drivers for the chipsets, there is a lot going on about chipset drivers and hamradio, especially when using baud rates below 9600.

If you're using the (virtual)comport only for switching ptt, you might as well use 1200-8-n-1...works for me switching my ft-7800e.

I wasn?t familiar with the website from K6AIX, but it sure is a nice one!
So this reflector always works 2-ways!

I hope this helped..

Joop Schalkwijk / PD2JAM.

For instance... you are sure knowing what (virtual) comport your ftdi chipset is generating? I assume that it is also set in your program?
Sometimes you have to search for better/different drivers for the chipsets, there is a lot going on about chipset drivers and hamradio, especially when using baud rates below 9600.

If you're using the (virtual)comport only for switching ptt, you might as well use 1200-8-n-1...works for me switching my ft-7800e.

I wasn´t familiar with the website from K6AIX, but it sure is a nice one!
So this reflector always works 2-ways!

I hope this helped..

Joop Schalkwijk / PD2JAM.

Sorry, original message deleted in (my)error. I always tell non hams that hams are a very bright group of folks, and that I am the dumbest ham I know. Anyhow, here it is again.

Hello all,

I have a ts450sat and put together a sound card interface by following the k6aix instructions available on the web. PTT works fine when plugged into the db9 port behind the desktop computer, not at all using the converter cable. I have tried setting port speeds to 4800/8/2/n etc.
The part# of the converter is ftdi UC232R-10. I gotta be missing something here. Tried on laptop, same deal. JT65-HF and hamscope, same deal. Any ideas are very much appreciated.

Thanks for listening,

Dave

Hi Dave

I'm confused Dave :-)

You should use the USB converter with a serial cable. Are you doing that. The USB/serial should just be for PTT.

You need a 2nd box for audio. That goes directly from the 13 pin din to the audio interface, then to the computer. The audio box would route the tx/rx audio, but the USB/serial converter would do the PTT.

I use an interface here from Buxcomm, the RASCAL. It has the audio interface and the PTT functions all in 1 box a(actually FSK for RTTY). To use it on the laptop, I have to use a USB/serial converter.

I'm not really sure which box you are using as the site I looked at had 2 different ones, one for PTT and one for audio.

You might try putting the audio in through the mic jack and see what happens. You could also use VOX.

If you are going to be doing RTTY, FSK is the best way to go as when in the FSK position on the mode switch, you can use the CW filters. In AFSK you are stuck in the SSB bandwidth. 73
Tom W7WHY

Hi Tom,

Thanks for the quick response. The audio is fed through the box from pin 3 of the 13 pos din to the mic in on computer. Audio from the computer is going through the box to pin 11 on din. PTT is going from pin 7 (rts) and pin 5 (gnd) on db9. all works fine except when I try to use the usb to serial converter.

Thanks again,

Dave

I'm the "not quite so confused Dave" :-)

I recently built a similar interface for my 850.

As I understand it the serial to usb converter is very unlikely to produce an RTS signal at all, so
there will be no PTT signal. These converters normally only use Txd and Rxd lines.

If you do not use a "genuine" serial port for these interfaces you need to build a small circuit
which picks off a little of the transmit audio signal, amplifies and rectifies it, and then uses it for the PTT.
Mine contains 13 extra components for this purpose, including 2 transistors and an optocoupler.
If you do not do it this way, it gets very messy with multiple wires to the interface.

I was inspired to build mine after reading the excellent web page of G4ILO (search on google) and following some of his links.
Mine has a cheap "USB sound card" in the interface, 2 transformers and an optocoupler for isolation.
It also has a switch to break the "earth" path between radio and computer (I will ignore any complaints about switches in
earth lines) and a switch allowing permanent connection of two radios with easy change-over.

I have two FTDI USB to serial converters. One is a USB/DB-9 dongle. The other is a FTDI USB serial module(from Mouser).

Both work very well. All the handshake signals work mostly as expected.

The one exception is if you try and set then clear a line too fast nothing happens.

I tried using one for bit banging programming interface. Wit some effort I was able to make it work.

I have been using these devices for several years using the handshaking interface and they do work in that mode.

Tom,

Some of the construction steps didn't seem to jive well with the diagrams on the k6aix document, but I did get it to work very well using the "genuine" db9 port. It seems the converter or my software setting are not so bueno.

Red,

Thanks for that input, I was hoping the converter was all that I needed. :(

Bob, Now I'm back at square one. I would like for mine to work also but maybe this is the excuse I need to go buy a ts590s!

You guys are GREAT! Thanks for helping me out here and I haven't given up yet.

11098. TS-850 SAT Filters

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-02-09 04:22:39 UTC
From: John Parker
Topic: 11098 Message: 11098

Aloha Everyone,

I purchased a TS-850 SAT from the bay.

Serial Number 50800147

It has one filter installed: Kenwood SSB Filter (YK-88S1) 2.7Khz

It looks like there are two sockets for two additional filters.

My questions:

Question 1:
I know that there are issues with the chips on the CAR? Board and that at some point Kenwood replaced them with different types.

Does anyone know if my serial number is safe? I guess it would be smart to look at the chips, but I honestly don't know where they are located.

Question 2:

Since I have this filter installed, what would be the best recommendation for other filters or replacement of the currently installed filter?

My plan is to have two TS-850s.

One designated for CW/Digital Modes and the other I will want to modify into the voodoo ESSB as I have two DSP-100s, one for each application.

The one I own currently will be for CW only any maybe some hf digital modes.

The second one I will want to modify the 850 and the dsp-100 for ESSB.

Any thoughts or ideas?

73,

John WH6DQU

John, If I'm not mistaken that filter YK-88S-1 is a 2.1 filter. You say you have 2 slots for filters but the 850 has 3 spots for added filters so it looks like someone added that filter leaving you the 2 additional filter spots. Make sure the switch is on to activate that filter or it does nothing and the rig won't even select that position.You have a good serial number for your DDS chips.I know you will enjoy one of the best HF rigs ever made!73, Bob WE6C

Hi John

Which ever filter you decide on, you should check Inrad filters.

http://www.qth.com/inrad/

I use them here in my TS-450's. Much better than the Kenwood filters. I have a Kenwood 500 cycle filter in one of my '450's and I'd say it's closer too 700 cycles than 500. I have 1 Inrad 250 cycle filter which works really well on CW and RTTY. 73

Well, to be perfectly honest you may have the newest DDS chips. However, I dont think any Kenwood 850 was safe from leaking CAPs.

The 2.7 you have are the factory filters on the board that are standard with the 850. You have one on both sides - You should invest in an 1.8 and a roofing filter mod from Inrad.net. Start there - and ask questions. I have a 1.8 on the 8.83 and with various combinations I hear and isolate very well.

One small piece of advise, having two 850s unless you run a contest station is like having a wife and a girlfriend. The two will eventually PMS at the same time and the grief is best when you have one to deal with. Its not good to have two women running over you at the same exact time cause they will leave noticeable tire marks on you from the rear wheels of their menstrual cycle.

Consider a 850 and maybe a 140 for digi ... maybe even a 440 but two 850 your asking for it. Want to have to of the same kind, have to Bud-Wise-ers - Thats a wise decision.

Welcome to the world of Kenwood.

Thanks Tom!

I'm kicking myself for getting rid of my mint ts-450!

Live and learn!

Hi Jordan,

I've read about the lp-pan.

I have an sm-220 and Sm-230

Would't either one of those do the same thing?

I used a SM-220 with my TS-850AT and had mixed feelings.

I like it at the time, because, I mean what else was there?? First reason I liked it was because of the trapezoid tuning for an amp -I was running a pair of 8877s in a Alpha 77SX at the time, and tuning was a breeze.

But in the panadaptor mode, the sweep on the right side of center frequency was 10 to 15 db down from the sweep on the left side - so it looked funny as you tuned down the band and a strong signal entered the left side of the scope and then went limp as you tuned past it.

Look on Youtube for LP-Pan ts850....
a big step up from the SM station monitors...
And you can do much more with it....

Check the description of your filter again. You should have room for three optional plug-in filters. It depends on what you are going to be doing with the radio regarding what filters you might want. If you are a contester, you might want a very narrow filter on CW. Personally, I think two 500 Hz Kenwood filters or even better, two INRAD 400 Hz filters are the best bet. I found the 250/270 filters too narrow for practical use. I have a 1.8 SSB filter YK-88SN-1 in the third slot. It does a pretty good job. I usually use it when I'm listening to CW signals and crank in the narrower ones as needed. Don't forget the radio has the slope tuning on both SSB and CW which works somewhat if you have no filters.

As far as the roofing filter, I think that requires a very high level of expertise to install.

There is only 2 plug in slots on an 850. Everything else is wire or solder.

There are 2 plug-in slots in the 8.8 IF on the RF Unit and one in the 455 IF in the IF Unit.

I think that's 3 plug-in slots.

Clif

Hey Clif .. first thanks for taking care of my rig. I love it.

Second where is the 455 slot? I am assuming its not visible or I simply
don't know where or what I'm looking at.

When you take off the hatch cover, there is space for two 8.83 filters next to each other, and the 455 Kcs is at the other end of the space.

Here are the instructions:

http://www.sk6aw.net/manualer/TS-850_Instruction_manual.pdf

Remember to set the dip switches so the radio know what filters are in what positions.

Paul K2BK.

Aloha Everyone!

I wanted to thank everyone who has joined this lively discussion as it has been a real learning experience for me.

I think I will go with the inrad filters. I¹m pretty sure I know where to look for all of them thanks to the group.

Sounds like a roofing filter is a good thing to add as well.

I read about that yesterday and it seems a little difficult to do.

The only issue of living on island is it takes so long for things to go back and forth to the mainland. So, maybe some day I will be brave
And attempt the roofing filter install myself.

I have to head out to work as it¹s not all about beach¹s and beautiful views living in paradise.

Mahalo Nui Loa (Thank You Very Much)

73,

John WH6DQU

Aloha Everyone!

I wanted to thank everyone who has joined this lively discussion as it has

been a real learning experience for me.

I think I will go with the inrad filters. I¹m pretty sure I know where to

look for all of them thanks to the group.

Sounds like a roofing filter is a good thing to add as well.

I read about that yesterday and it seems a little difficult to do.

The only issue of living on island is it takes so long for things to go back

and forth to the mainland. So, maybe some day I will be brave

And attempt the roofing filter install myself.

I have to head out to work as it¹s not all about beach¹s and beautiful views

living in paradise.

Mahalo Nui Loa (Thank You Very Much)

73,

John WH6DQU

That is true. They give you explicit instructions. Not complicated.
Check their web page.

Just snipping a couple of unused pins off. Doesn't affect if you want to use Kenwood filters. They will still work with the pins snipped off. 73 Tom W7WHY

Subject: [TS-850_450_690] Using a Heathkit QF-1 Q-Multiplier w/the TS-450

I recently acquired a QF-1 Q-Multiplier for chump-change.

It occurred to me that because the QF-1 operates at 455kc I should be able to substitute it for a DSP-100.
Which rear panel jack(s) will give me access to the 455 I.F.?

Also, down the road I am considering replacing the 12AX7 in the QF-1 with a pair of transistors. Does anyone have any ideas on what transistors would give an equivalent gain?

Curiously,
Ron

11123. TS450/690 Warning

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-02-13 18:08:03 UTC
From: avvidclif
Topic: 11123 Message: 11123

Over the past few weeks I have had to repair several TS450's that had a problem with the audio cap leaking (C104 on the IF unit). It can cause low rx audio, static, and no rx audio. The leaking chemical can damage traces and thru holes in the area with multiple results ranging from no rx to DSB rx all the time, AIP not working, etc.

If you own a 450/690 I recommend you check for this cap leaking. To do that remove the bottom cover used to install filters (2 screws). In the middle of the opening is a heatsink oriented front to back. To the right of it are 2 small black 455 filters and a larger chrome one. Just behind the filters is the cap. Look closely at the PCB with a good light. The board under the cap should be clean with no discoloration. Any signs of leakage the cap needs to be replaced. Even if you are not having any problems, you will down the road.

It is a 470uf 10v Electrolytic with a 105 deg rating, lead spacing is 5mm. I use a 25v in place of it. Make sure to clean the board real well.

Clif

I opened up both of my radios, 450/690. The 450 already had the cap replaced. The 690 looks perfect. My replacement is green. The original falls between purple and brown.

11130. TS450 key clicks

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-02-14 17:38:28 UTC
From: k3mrk
Topic: 11130 Message: 11130

Last evening I was calling a dx station with about a 1khz split on 20m. Another fairly strong station came on the dx freq and said I had "big clicks" this is the first I have received a report like this. In the old days if you had a click, you would put a cap across the key terminals and that would fix it. With a newer rig and electronic keyer, I am lost as to how to solve this problem. Has anyone else had this issue with a 450? What must I do to correct it?

I would suggest that you ask another station if you indeed have keyclicks. I have a station nearby who seems to have key clicks but. They seem to disappear when I hit the attenuator. He was probably just overloading my receiver.

From: Tom Osborne
Topic: 11130 Message: 11132

Hi Mark

Some times someone telling you you have clicks means there is something wrong on his end. I have 2
TS-450's here and have never had problems. If they have their NB turned on, some stations have horrible clicks. Best thing is to have a friend close by check for you. 73
Tom W7WHY

Last evening I was calling a dx station with about a 1khz split on 20m. Another fairly strong station came on the dx freq and said I had "big clicks" this is the first I have received a report like this. In the old days if you had a click, you would put a cap across the key terminals and that would fix it. With a newer rig and electronic keyer, I am lost as to how to solve this problem. Has anyone else had this issue with a 450? What must I do to correct it?
Mark

I like that approach... much simpler, probably cheaper than two new transistors and two diodes, or almost any of the other fixes.

Thanks for finding and posting the link.

Hi Mark,

If the receiving station is hearing you quite strongly and has his/her noise blanker enabled, the NB is likely making it _appear_ as though you have clicks. The effect on fone is distorted audio.

Your monitor oscilloscope will tell you if your keyed waveshape is too hard. My TS-850 produces a nice waveshape... not hard at all.

Thanks for all the info. It took me by surprise because I was at a loss as to how to cure a click problem on a modern rig. It was a close split, he was the loudest sig on the band. When I hear a key click on my end, it is due to a strong nearby sig and my noise blanker. Turn off the NB and its gone.

I also got a direct response from a helpful ham that talks about the time lag for the PLL to change to the transmit freq. When I used WinKey to send, I got multiple reports of key clicks, so I stopped using it. This is probably due to the rig keying.

The first thing I will do is getting someone to take a listen and see if the problem really exists.

Thanks for all the help and I'll let you know what I find.

Mark

Mark,

Again, the best way to determine if you have clicks is by looking at the waveshape using your transmitter monitor or test bench oscilloscope. If the waveshape isn't hard (sharp corners), you don't have clicks.

The first thing you should do is use your oscilloscope to see if the waveshape is hard or not. If not, you're done -- no need to bother with someone giving you a subjective report.

11140. TS-690S DISPLAY NEEDS TO BE VIEWED AT AN ANGLE, HELP!

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-02-19 01:36:03 UTC
From: gringo
Topic: 11140 Message: 11140

The display tube is working fine and plenty bright.

The display looks garbled and unreadable with all digits lit up when looking straight at the radio.

If you look at the display from a sharp angle everything can be viewed fine.

Anyone have any ideas of what is going on? Is the 450S display board the same as the 690S?

Thanks
Chris TI2/AA8VL

11141. Re: TS-690S DISPLAY NEEDS TO BE VIEWED AT AN ANGLE, HELP!

From: Rick Allan
Topic: 11140 Message: 11141

If it can be viewed from a sharp angle from below or above, it could be a contrast adjustment issue. If from the left or right, I haven't a clue.

11142. Kenwood PS-52 for TS-850

Hi Everyone,

I have a PS-52 Power Supply that I purchased off of e-bay and I¹m just getting around to taking a look at it.

It powers my TS-850 just fine.

The only thing I notice is the LED for power on doesn¹t come on.

I¹ve checked to make sure the connector is on correctly.

Anything else I can check or do?

If I need to replace it, I have no idea how to get it out of that tight holder.

Thanks in advance.

Of course if this isn¹t the appropriate forum then please direct me to where I need to post this question.

73,

John WH6DQU

11143. intermittent cw tx problems TS-850S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-02-19 06:20:24 UTC
From: Ramon DU1FV
Topic: 11143 Message: 11143

Hi!
I thought i would share this bout i had with a used TS-850s I got recently. It seems that when i use my paddle i sometimes experience "misfiring" on TX. When I put the switch on "off". there is no problem. The "straight key" mode works perfectly. I ended up opening the radio and monitored the "key" test point to the right of cn2 of the if board. it seems that when the internal keyer is operated the voltage does not quite drop to zero, usually mid level (when the thing starts acting up), so the rf output is a mess. I pressed on the switch and lo and behold it seems to work fine. I sprayed some contact cleaner and worked the switch several cycles and I think that did the job. The former owner is an SSB-only operator so the switch probably hasn't been touched much and the contacts haven't "self-cleaned".
The voltage on the "key" test point now switches to ground very cleanly.
This is a condensed story involving about two weeks of anguish and gnashing of teeth. At one point I even suspected the dc-dc converter board and tried changing the bias resistors. Maybe I should think of putting back the old bias (22k) resistors in, but maybe later as these old eyes kon't enjoy working with this minisclue parts (should I leave the 13ks in?).
Anyway, I hope this post helps the next guy who get the same problem.

The problem is the LCD display it self no contrast adjustment inside the radio. I did try to bring down the light intensity of the flourecent back light but it didnt help. You have two option

1st- Replace the whole display unit, sometimes its available in ebay.

2nd - Do the same on what i did in my 450 and another 690,on top of the LCD display place a light colored car window tint, a light tint color will do. It will block the intensity of the display and will just show the correct number that is really illuminated. This sounds funny but it worked for us here in Philiipines were we cant buy or find a replacement parts easily.Try this its a lot cheaper than replacing the LCD assembly unit.

Thank you very much for the reply. Tomorrow I will buy some window tint. Near me in Costa Rica is a car window tint shop so maybe they will have some scraps for me to buy. I've noticed the viewing angle is best at the left-top of the radio. If this works you have just helped out a 6m contest station here. I will post my results. Thanks again!!!!

Alex is right. The best solution is to get another display perhaps off ebay.

I am in the same boat as you. I have a friend who has another ts-850 and the display is perfect. I have studied this in depth and concluded that it is caused by subjecting the radio to excessively warm environment. There are two plastic polarizing sheets in the front and back of (towards the back light) LCD> All LCD's have this polarizers. I took a close look at mine noted that the front sheet was slightly wrinkled probably because of heat, age, etc. If you are adventurous you could probably lift some polarizer sheets off some cheap digital wall clocks (you have to clean off the glue backing according to some websites), and use those. According to a Japanese maker of replacement polarizing film for notebooks and tvs, poor contrast means you have to replace the back filter as well. This is quite a pain to do and not for the faint of heart. Fortunately, in my case I can position the rig on my table such that it is at an optimum angle that gives me a tolerable view. This is a usual problem with the a lot of TS-850s.

Right now the rig just about level with my eyes but slightly to the right, and it is tolerable. But every time I see my friends TS-850s fine display I fantasize about doing the mod. hihi.

Btw, I have seen two units of a yaesu mobile radio with a display similar to the TS-850s. The one that was used a lot in a car has poorer contrast than the other which was not mobiled at all. Maybe the heat in the parked car in summer degraded the polarizer film. I also read that LCD speedometers of Corvettes suffer the same fate and have to have their polarizers replaced.

There you go!

Chris

My pleasure to give info and help, it will work for sure if the only problem is to much brightness on the display numbers. Only draw back is if you bring the radio outside or on a field operation the display is dark to see because of the tint but if you block the brightness going to the display it wont be a problem. If you use the rig inside the radio room its ok no more viewing angle to see.

Pls give us feedback, for the tint no need to buy just ask for excess tint they have scrap tint for sure, you only need few inches of it.

Aloha All,

I did a search for the Kenwood DSP-100 and to my surprise, the results indicated that it can be plugged into the side connector on the ts-450/690.

Does the 450 have a din plug connector on the left panel side? Or is that for the 690 or both?

Hello group, I am new to the group. I want to know if any has had success using Ham Radio Deluxe with a TS690S? I am using a Signalink USB for PSK31 but cannot use HRD.

11155. RE: [TS-850_450_690] HRD with TS690S

Are you talking about radio control with HRD, or dm780 use for the signallink usb??? What can you not do??

As long as you have been able to tell dm780 which sound card you are using, (i.e. the usb signalink) than it should work fine. Do you have other software running that could be control the sound or control?

You also need a CAT control cable. The Signalink is only for Audio to and from the radio it will not do CAT Control. For that you need a TTL to RS232 converter G4ZLP makes some great ones for a very good price. http://www.g4zlp.co.uk/unified/KenwoodCAT.shtml the 3rd one down is the one I have been using for over 5 years now on my TS-850. If your computer does not have a 9 pin RS232 port you will need a USB to RS232 converter get one with the FTDI? chipset.

On my ts450 I was able to get rig control via HRD using a TTL-232R-5V-WE cable soldered to sd-60 CIRCULAR DIN 6 PIN MALE connector and programming the cable using ft_prog to invert the txd and rxd. Nice and clean using the 6 pin connector on the side of the rig to usb on the laptop. Can even control the rig from the couch downstairs using skype for audio. Basically I followed an article found on the web only I used the open wire end cable while they used a breakout board.

David:

Sorry about Hijacking this thread, but I have the info you're looking for.

Here's a link to the article I followed. It used the breakout board, but it went together quickly, and works FB with my TS850.

If I was to do it over again, I would get the USB cable with the converter built in from Mouser, just makes for a cleaner project.

Hope this helps.

Topic: 11161 Message: 11161

I have a Kenwood

TS-850SAT with original box serial #41100xxx

SP-31 Speaker with original box

PS-52 with original box

The DRU-2 Recording module for the TS-850

and Kenwood Interface IF-232C c/w Ham Windows software (not sure it will work with newer computers)

I am thinking of selling the rig and upgrading to a Kenwood TS-590s

Am I wise to consider that or should I keep the 850?

I love my 850, it is in good working order, but the DSP units have peaked my interest with what appears to be better audio with the proper filtering configured.

That is the link I used, thanks Mike. I got the cable and connector from a vendor that offers 1st class mail as a shipping option on small orders so I saved over 4 bux on shipping. That was "key" for me.

I have both. Actually two TS-850S's. The TS-590S has a quieter receiver. You will be able to pull some of the very weak ones out on CW that are hard if not impossible to hear on the 850S. That is a fact. However, I'm sure some of the value of this depends on the noise at your QTH. I think the front panel on the 850/870/450/690 (have them all) are much easier to use. I personally don't like the sub-menus. For example, you can't just crank carrier up or down from the face of the radio without entering a sub menu. You can't turn the audio monitor off or on. You have to go into a sub menu. I wouldn't let this put you off though. I have heard owners of the K3 say the 590S is a piece of cake compared to Elecraft's sub menus. I can't speak from experience though.

My suggestion. Keep your 850S and get a 590 too. I go back and forth between mine as well as the 870 and 690. I will tell you that the 590 slaughters the 690 on six meter reception. Your mileage may vary.

Hope this helps.

You wanna keep the 850. 1 big reason you wanna keep it is because the 5 ninety's, according to my personal experience using it does not have the selectivity that the 850 has. The 590 does not here like the 850.

590 is a great radio, similar to the 570 with the exception of roofing filters being at it and some other select ability. However, it is not an 850 and no uncertain terms.

Rick:

Glad to hear you have a wonderful 'old friend' like the TS-850. My buddy has a TS-940 and loves it, but in his less 'romantic' moments he realizes that for serious contests his Icom 756 Pro III is his only realistic choice. The 940 now spends about 1/4 of the time being shipped off for another repair, but he loves it and will never let it go.

The 590 is a tremendous radio, but without the personality of a 940 or 850. It works so well, so easily, that you can easily start to take it for granted. If you can, keep the 850 and enjoy them both. I have a ts-690 that I really like, and use at a vacation home. But for a contest, the 590 wins hands down.

I hope this helps - enjoy your 590 if you go that way! Be sure to upgrade it to the 1.06 firmware if comes with an earlier version - it makes a big difference. BTW, if do sell the 850, it should interface nicely to HRD with that rs232 adaptor you mention.

You guys with this issue should consider an LP-Pan system....it turns your 850 rig into a dual rig using Psdr DSP and filtering ...

The 590 is a tremendous radio, but without the personality of a 940 or 850. It works so well, so easily, that you can easily start to take it for granted. If you can, keep the 850 and enjoy them both. I have a ts-690 that I really like, and use at a vacation home. But for a contest, the 590 wins hands down.

I hope this helps - enjoy your 590 if you go that way! Be sure to upgrade it to the 1.06 firmware if comes with an earlier version - it makes a big difference. BTW, if do sell the 850, it should interface nicely to HRD with that rs232 adaptor you mention.

Rick ,
Any chance you know someone with the 590 ?
Try to get a chance to sit behind it for a long test drive , and then what are you favorite modes , a friend wanted to trade for mine , because he said something about AM on the 850 he missed since he sold it , so he regretted selling .
Also a well set up 850 has some of the best audio on the airwaves , I have had operators during contesting in a pileup ask about my station , because of the good audio they received .
I want to get some other rigs - Icom 756Pro II & Yaesu FT-1000 , but I am also looking for a spare TS-850 just incase of issues , I already did all the caps on CAR board , battery & some caps for display on mine .
I would miss the 850 if something unrepairable would happen .

11171. TS-850 - receiver overload

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-02-28 15:44:27 UTC
From: Kurt Cathcart
Topic: 11171 Message: 11171

My TS-850 has seemed to have developed a problem. Stations that are S9 or better are overloading the receiver. Stations that are as far away as 25 or 30KHz are causing interference even though I'm a 1.8k filter and the DSP-100 filter settings are narrow. My TS-450 and R-5000 with the same filter don't seem to have this problem. Yes the AIP and attenuators have some affect but I don't think a station that far away should be a problem. I also frequent a net so using the AIP and attenuator puts me at a disadvantage for the weaker stations.

Topic: 11161 Message: 11172

Keeping the TS-850 looks fine but:

Don?t forget the age of the rig...it is probably 25 years old or so.
I had one of the latest series and sold it thinking it was still okay.
The next owner first did a complete revision of all the caps, because
there were already a few leaking. He also did replace the battery which
was starting to leak.

What I mean is: You must do the things standing above for keeping it
alive, or just selling it.
Every unrecapped TS-850 will probably have leaking caps by now, so add
also the price for a re-cap when you want to keep it!!

I sold my TS-850 because of the tiring noise in the narrow filtering.
Bought a 2nd hand ft-1000MP Mark V Field. That means analog and/or
digital filtering, just how you want it.
It took abouth 4 months for adjusting my thinking and doing, because
almost everything worked in a different way, or was in a different place.
I wanted a "big" radio, with "big" knobs, easily adjustable.
As soon as Elecraft makes the K3 in this size, I will have a divorce and
buy it!

Joop Schalkwijk / PD2JAM

Hi Rick

Those TS-850's are really nice radios.

Only problem is that parts are getting hard to find (and expensive). About the only place you can get most of the boards any more is on eBay and they charge an arm and a leg for them.

I have 2 TS-450's here and plan on keeping them till they just don't work any more. 73

I have a Kenwood

TS-850SAT with original box serial #41100xxx

SP-31 Speaker with original box

PS-52 with original box

The DRU-2 Recording module for the TS-850

and Kenwood Interface IF-232C c/w Ham Windows software (not sure it will work with newer computers)

I am thinking of selling the rig and upgrading to a Kenwood TS-590s

Am I wise to consider that or should I keep the 850?

I love my 850, it is in good working order, but the DSP units have peaked my interest with what appears to be better audio with the proper filtering configured.

I must apologize for the late response to all those who provided input to my question. We have been watching our 16 month old grandson who kept us quite busy the entire time he was here.

I am not an overly active Ham Radio operator, using my rig only 1 - 2 hours per week at most, most weeks less than 30 minutes. I retired a year ago, but so far have found little additional time to spend on the radio.

As many of you have stated, the 850 is a great rig, with many features and awsome receive capabilities. But, the hearing is not what it use to be so I think I will sell the rig now and purchase one of the newer DSP rigs such as the TS-590.

So, if you are looking for a good used TS-850SAT I will be selling it on eBay, posting it next week. I will also be selling the PS-52 power supply and the SP-31 speaker, all in their original boxes.

I have not been on this group long, but I did find the post most informative and a great group of people willing to share their ideas and solutions.

Again, thank you to all who responded

Hello! I have a TS-850 that has distorted transmit audio in all modes and in all bands. In AM and SSB, I can hear a raspy sound, even though the microphone is removed. Additionally, in CW the CW note has a warbling and raspy note. When hooked up to a battery the distortion is worse. When the TX audio is monitored with the moni function, the TX audio sounds fine. When connected to a battery, the distortion is worse. Receive audio is fine. ANy ideas where I can look?

Have you got any modem or computer plugged into the back of the TS-850 ? There was a problem (and there is a mod for this distorted audio when you have a modem logged into the back of the rig)
If not that, then it sounds like RF feedback. Try grounding your rig well on the earth screw
at the back

Hello John;

I guess I should have been more detailed in my description. The distorted TX audio came on suddenly and I did not have any modem or computer plugged into the radio. I am aware of the issue you raised, it is in one of the bulletins put out by Kenwood. It is not applicable here. The raspy sound I described with the microphone removed in AM / SSB was with power, mic gain and car controls at minimum, while in transmit mode into a dummy load as monitored in a seperate receiver. The receiver had a short antenna attached to it, and the 40Db attenuator was selected. The radio was being used in my vehicle at the time and the case was properly grounded to the vehicle chassis. The antenna was the same mobile set up I have been using for several years and was also properly installed. As a precaution, I did check for any loose connections, or damaged coax at the mobile antenna. Everything appeared to be in order. A common mode choke was used to help prevent RF currents from traveling along the coax back to the radio. My first reaction, after confirming the problem, was the possibility that one of the capacitors had leaked on the CAR Unit, especially that 47uF 16vdc electrolytic, but I could not find any evidence of leakage at any of the electrolytics on that board. All of the DDS chips on the board are the newer units. When I monitor my TX audio by using the Monitor function, the audio sounds fine. I used the microphone and the DRU-2 to generate the test audio. The monitor audio is detected at the 8.83Mhz IF, before the final TX mixing occurs. I then monitored the TX audio at the input of the FINAL Unit with the same distorted audio result. I have a spare, defunct TS-850 given to me by a Mariner that has corrosion issues, but most of the boards look clean. I could swap them out one by one until the problem gets fixed, or worsens. I dont want to have to do that if I can avoid it.

Usb to serial ????? can you be more specific as to which one. Does it include the if232c to 6 pin din for the 690, or is the 690 different

Does it have the chipset needed or installed???

Settings should be 4800,8,n,2, check control panel to confirm the com port assigned to the device...

Hi,
With the USB cables that have a chipset for serial conversion built into the cable require an appropriate software driver for the USB. I bought one from Ebay. The seller gave the URL link to be able to download the appropriate driver but did not provide a CD with the software on it with the product. Please go back and read the Ebay ad carefully where you bought the USB to 690 attachment cable. 73, Mel - KF6OZ

Topic: 11181 Message: 11188

I see this in an affordable radio Ebay ad:
TS-450s, TS-690s, TS-790s, TS-850s, TS-950s

* TS-140s, TS-680s - requires Kenwood IF-10C
* TS-711A, TS-811A - requires Kenwood IF-10A
* TS-50s, TS-60s - requires Kenwood IF-10D
* TS-940s - requires Kenwood IF-10B
* TS-440s - requires Kenwood IC-10
* R-5000 - requires Kenwood IC-10

USB driver download from here: usbdriver.zip (we do not ship software
CD)

if your radio model not listed above, please see my other item or email
us.

The "here: usbdriver.zip" is the link you need. You also may have to
interact with
the XP or Win7 control panel (Device Manager) to see which COM port it
gets assigned to when the
machine starts up. Device Manager shows mine coming up on COM6 on my
Win7 laptop machine.
73,
Mel - KF6OZ

Did you go to device manager and see which comport the USB cable is set to?
HRD has to be set to the same comport.

I have a TS-450SAT and they are about the same. The settings on mine is
4800, CTS and RTS checked.

Did you do an 'auto detect' on HRD? It will step through the comports and
find the right one and the right connection speed. 73

Dave is right. You need a CAT cable, not just a plain cable. I misunderstood your first question.

If you Google ZLP Electronics, Neal has some good cables for the 450/690 radios. He has some serial cables and some USB CAT cables. They come from the U.K., but he makes some really good stuff. I have 3 of them here. Only took 6 days to get it from the U.K. 73

Tom W7WHY

Usb to serial ????? can you be more specific as to which one. Does it include the if232c to 6 pin din for the 690, or is the 690 different

Does it have the chipset needed or installed???

Settings should be 4800,8,n,2, check control panel to confirm the com port assigned to the device...

Hi Martin

Q50 is to the left and just below CN6. It is next to C212.

R46 is on the bottom edge of the board, just above CN5 and next to C35.

Hope that helps. 73

11194. adjusting display , manual ?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-03-09 14:53:42 UTC
From: johnfaughn
Topic: 11194 Message: 11194

I bought this radio last end of summer from a silent keys estate and it had a number of issues with leaky caps , the CAR board , then a couple of through-hole in the power area near back of rig .
Replaced all of those and changed out the battery & holder .
The display was still a little off 3 to 8 kc depending on band , I tried to use the method in the owners manual [like many there is a lot left out] , it says to remove CAR board , but not specific weather to just get out of way to put jumper in place , or to disconnect all electrical connections for this proceeder .
I do not seem to get the rig to respond during adjustment , with CAR board laying to one side but still connected .
Also I would think a more precise way to do , would do adjustment while monitoring a voltage or frequency , but that is not mentioned .
Any info ?
Thanks John

From: Richard Schmuke
Topic: 7959 Message: 11195

This might be a little off the group guidelines but I tried to join the 590s group and got no response. I have a TS-450SAT and I am getting ready to pass it on and get a new TS-590 rig. I have a question for any one familiar with the VGS1 voice recorder. Everything I read about it is about recording incoming sounds off the air and letting you know information on your radio. I have no interest in either one.

My question is it any good for recording your voice and calling CQ and/or contesting. If it does not work as easy as other push button recorders I don't want to waste my money. I already have a MFJ-434B

I called a couple of dealers and they could only repeat the advertisement information on receive recording.

Topic: 7959 Message: 11196

I am looking at purchasing a TS-590s once I sell my TS-850 on eBay. I printed out the manual and just finished reading through the section on the VGS-1 option.

It does, if you turn on the option in the menu, play the last 30 seconds of received audio and if turned on will give voice prompts to settings but it will also allow you to record 4 different (only 3 if you use the last 30 seconds of received audio option)

The first two are 30 seconds each and the last 2 are 15 seconds each. You can press the appropriate button to play back just one of the recordings or press two or more of the buttons in the sequence you want to play back each of the recordings in sequence. There is also a setting to adjust the time between recording playback (1 - 10 seconds)

To record you press and hold the [CH1 (REC)] or [CH2 (REC)] [CH2 (REC)] or [CH3 (REC)] or the [RX/4 (REC)] button. To play back the recorded audio from any of the 4 recordings you quickly press the same button while pressing the Send button or holding down the Mic button. You can also adjust the playback volume by adjusting menu option 05, menu option 06 is used to adjust the volume or turn off the Voice Guide option 09 turns on or off the Auto Announcement.

You may want to go to the Kenwood site and download a copy of the TS-590s manual for full details, but the above describes what it can do, just not the details on how to record the recording, clear them or erase them.

If you figure out how to join the TS-590s group let me know as I have not had any success as yet.

Rick

Thank you for your help gentlemen, the VGS-1 is a good thing I am sure but it does not sound like it suits itself to contesting as well as my MFJ-434B. The MFJ has 5 buttons on the front and a quick press starts the five different recordings and if you hold it for about one second the recording will repeat with a delay amount easy adjusted with a knob on the front. To record is just as easy. I will order the TS-590 and look forward to the next contest and better receiving.

Who's giving the 940 a bad rap? I have a 940 and a 930. Both are good solid radios but they have different feels. The 930 is good for rag chewing - the receiver is smooth and quiet but not as selective as the 940. The 940 is more selective but the AGC action is not as smooth as the 930. The 940 has an improved power supply, and can be computer controlled. You kinda need both....

I posted a set of pictures if needed on Photobucket. The radio was not in use for about 7 years when I lived in a restricted area. I retired, moved, then in the summer of 2007 I sent the radio to Communications Services and had it gone thru by Cal Fisher NF5P. It was all checked and recalibrated and came back at 105 watt CW.
It has been run on SSB all the time so never at full power CW.
Original book, shipping foam and boxes, power cord, mike plus the computer interface cable.
Built in antenna tuner. S/N 603000xxx I have seen clean rigs like this go as of late for $550. Never been to field day with it , I have a TS-430 for field day. I just ordered a TS-590S and need to room.
I am asking for $500, OBO, plus shipping to you location.

Who's giving the 940 a bad rap? I have a 940 and a 930. Both are good solid radios but they have different feels. The 930 is good for rag chewing - the receiver is smooth and quiet but not as selective as the 940. The 940 is more selective but the AGC action is not as smooth as the 930. The 940 has an improved power supply, and can be computer controlled. You kinda need both....

Hello Group. I thought I would offer this here to Kenwood aficionados before I pursue other venues. I am considering parting with my Kenwood ts850at/DSP-100 combo. Both units work as they should and will only be sold together. Instead of tying up space here PM me for more information. To save my time and yours, serious interests only, please.

Eric, kr9w

11209. Re: TS-850 distorted TX

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-03-19 07:29:33 UTC
From: Eric
Topic: 11179 Message: 11209

I haven't had a chance to dig further until this weekend. The VCO voltages are within specs. Seems the problem is somewhere in the RF board since the MONI Audio is normal. Now the Carrier Board electrolytics are leaking since I have the radio hooked up to 13.8VDC. Previously, I used a deep cycle battery to power the radio. I pulled the board, removed the caps and washed the board with distilled water. I then placed it in a drying oven set at 125 degrees with warm air blowing across the board. A known good CAR board did not solve the distorted TX audio problem. Does anyone know the Mouser Electronics part numbers for the replacement caps?

Try spinning the cap in LO2 on the PLL unit for several turns and resetting to spec.

The leaking caps I am.about 97% sure are ur problem. When that gook gets on the board it impends the electric flow to everything on that board especially the dds chips which is where your distortion may be coming from.

I had the same issue back early this year and I replaced the caps, had the board cleaned up and I have had absolutely no problems sense.

11212. display is off , adjustment ?

Yahoo group: TS-850_450_690 (2010 — 2016)

From: johnfaughn
Topic: 11212 Message: 11212

I've got a TS-850S , replaced the leaky caps on CAR board , the battery & holder , also a couple of through hole caps when the display did some odd things .
That was about 6 mths ago , but the issue since has been the display is off frequency , depending on band , .03 to .16 hz .
I tried using the manuals adjustment procedure , a couple of questions there , is says to remove the CAR board , but no detail , whether to move to get access to jumper points and whether or not to disconnect harness's ?
Also seems to leave out some details about tuning and adjusting , I do not seem to get any response when turning the adjustment ?
Thanks John

FWIW I used these from Mouser for my carrier board:

1 qty 647-UUD1E470MCL - 47uf, 25v
10 qty 647-UUD1E220MCL - 22uf, 25v (Mouser didn't have 10uf in stock at the time)

This was about 5 years ago, so I don't know if the same ones are still stocked. There are some pictures at http://zievid.com/W6OT/TS-850/TS-850.htm

Rodrigo I know this post is old but have you ever come to fix this problem?

I also have just pulled my old 450s out of mothballs and are having the exact same issues you have described. It started out with a "static crash" sounds in the rcvd audio (internally caused not atmospheric static crashes) then the volume would reduce noticeably until yesterday when like you, I powered the radio up and the audio would be there for a second and then the rf gain bargraph would go full scale and the audio would be gone completely if I turn the rf gain to zero and quickly back up to 10 the audio will come back strong for a second but the bargraph will climb rapidly back up to full scale again. Slowly as the radio heated up the audio would return and the bargraph would drop to normal with the exception that all rcvd signals would be at most s5 or no s reading at all...

I will check c104 on the if unit as per clif's instructions but was wondering if that was the total cure for your problems!

Tnx Clif,

I appreciate the fix and all the info. I had noticed that the old thread ended rather abruptly and didn't know if there was anything else I should be made aware of...I am going to replace the cap and will keep you informed on how it worked out for me.

Thanks again for your info!

> >
> > I also have just pulled my old 450s out of mothballs and are having the exact same issues you have described. It started out with a "static crash" sounds in the rcvd audio (internally caused not atmospheric static crashes) then the volume would reduce noticeably until yesterday when like you, I powered the radio up and the audio would be there for a second and then the rf gain bargraph would go full scale and the audio would be gone completely if I turn the rf gain to zero and quickly back up to 10 the audio will come back strong for a second but the bargraph will climb rapidly back up to full scale again. Slowly as the radio heated up the audio would return and the bargraph would drop to normal with the exception that all rcvd signals would be at most s5 or no s reading at all...

I am parting out a 5Mil Serial number 850 that had the case damaged in shipping and the new owner does not wat to look for a case for it.
The radio works fb so to get most of his money back the parts are up for sale.

CAR board no leaking caps very clean has the 66312 dds chips $325 obo.
Antenna tuner works great $175 obo.
Digital board has remote battery holder attached $125 obo
Front face plate very good condition complete $ 125 obo
RF board stock filters $125 obo
IF board stock filters $125 obo
PLL board $75 obo
Final board and filter board $150 obo

Listing here first before it goes to ebay thought you guys should get first chance. All prices plus 1/2 the shipping costs.

Last week a CAR board went for 375 on ebay and another went for 350 the last dds chips I saw for sale were for 100 each. There are none of the chips available any where at any price except this board that has 4 of them plus the board that is in great shape. If you can find them cheaper go for it good buddy.

Supply and demand. If the board is as described, $325.00 is not unreasonable. I have a carcass 850. The CAR board is clean. However just one chip is the old DDS chip and it is this chip that has to warm up for a couple of minutes before it works.

11224. Re: Kenwood TS-450S Internal ATU Problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-03-26 21:17:56 UTC
From: Rob
Topic: 11007 Message: 11224

You need to null the SWR detection circuit on the main filter board. Transmit some RF (20W or so) into a 50 ohm dummy load in the THRU position and tune TC1 for minimum voltage measured on pin 1 of CN8. This is the SWR detection circuitry that feeds the CPU which controls the signals to the ATU.
Also check that your ground and centre pin on the SO239 is in contact with the filter board via the small link wires. These sometimes work loose as the panel "flexes" if too much pressure is applied to the connector.

Yes, those are DIN plugs you need (the sockets are mounted on the radio, of course). You need to find an electronics parts retailer, which likely exists in any of the larger cities. The internet is your friend in this, as you can search for "13 pin DIN" and the name of your nearby city. Of course, in Penzance, there may be no nearby large city. (Yes, Falmouth may actually have such a retailer) The telephone "yellow pages" could also get you well started in your search.

Good luck,
Dan AA3LS

Which ones, the 6 pin for interfacing the rig control, the 7 ? pin for relay and amp connection, or the 13 pin din for sound card accessory

Perhaps the device you need may already have them mounted??

Buxcomm sells them , most electronics stores should have them, where are you located, Canada? USA?? abroad???

Also , if you are the original owner, or lucky enough to have bought it 2nd hand complete, the radios came with those connectors..

Be careful. There are 2 different kinds of DIN connectors. Most US din plugs will not work, different angle on the pins. If it doesn't plug in very easily then it's probably the wrong one and can break the un-obtanium jack.

This applies to the 6-7-8 pin. I don't know about the 13.

Clif

Dave, I confirmed that it was static from my R7 vertical ! An indication was that a bleeder choke at the R7 matching unit, failed, found it open circuit. ! The TS850 kept on working !

Dave,

Connecting a condenser microphone to the mic input, failed.
There is another mic input on the acc socket at the back.
I am located in 9H1, EU.

The 3a fuse on the back is for the AT300 socket, nothing else.

Going in on pin 11 (or was it 3) of the 13 pin plug, but WHY does the mike not work, as far as I remember the 2 sockets are in parallel, so if the front does not work, the rear may not as well, also depending if you are keying the rig from that 13 pin connector, it MUTES the front mike jack, perhaps that is happening without anything plugged into the jack???

Dave, I am getting some audio out, but extremely distorted and unstable. It is either a matter of matching (the TS850 is designed for 600 ohms mic in) or the 8 volts not properly connected to the condensor mike unit. I have a tried another externally powered condensor mic, to no vail. The problem is that I do not have any info about the mic. From the PC soundcard connections, I figured out that the tip is the output, adn the ring is the bias. But there are mics who bias and output from the tip ! Confused !

I think I am totally confused but in the event I am not.

Condenser mics (those like AKG or Audio Technica) that are for studio use
need 48v power to function properly. You have to run an external supply as
the radio wont supply that current in the mic or accessory ...

if you are talking about the tiny 5v condensers I dont know but Clif should
be able to tell you if the rig will allow for that type microphone.

11240. TS-450 Cap Refresh?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-03-29 17:24:03 UTC
From: Josh Gibbs
Topic: 11240 Message: 11240

Hi Gang,

I don't have any problems with my rig, but I want to move the battery / replace some caps as a preventive measure. I'm hoping to compile all relevant info on this job into this thread, and also put it all into a PDF in the files section. When I do the job I plan to take some detailed photos of exactly which caps should be replaced.

I have been searching old messages for info, and so far have found the following:

Message #11123 - executive summary: 'replace C104 on the IF unit - its a known leaker'

Here is a good write-up on moving the battery:

http://www.k5pa.com/Ham%20Radio/Downloads/Kenwood%20TS-450S%20Memory%20Battery%20Replacement%20Rev-A.pdf

Specific to the 850, but has some good pictures of what a failed cap looks like:

http://www.zievid.com/W6OT/TS-850/CarrierBoardCaps.htm

Please, if you know of other common leaky caps on a 450/690 reply to this thread. Or if you have other relevant info - much appreciated. I'd like this thread to be a 'one stop shopping' experience for future owners looking for this info.

Thanks,

-Josh KD7PAJ

One other tidbit I forgot to include. I found some comments from Clif that replacing ALL the caps is overkill - the 47uf and 10uf caps are the ones that fail most often.

So it might be reasonable to just replace those, and then do an occasional cap inspection? When these things go, is it pretty quick or a slow process?

-Josh

Hello Josh;

I have an 850 with distorted TX audio. When I first looked at the rig, the caps on the CAR Board were fine and showed no sign of leakage. After being hooked up to a 13.8Vdc supply for just a couple of days, they started leaking and caused minor damage to the CAR Board. I removed the caps from the board and stopped the corrosion process. I have to repair the corrosion damage but do not expect any problems. To make sure though, I will install the repaired board into a known good 850 to test it.

11243. TS-850S ALC Pegging

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-03-29 23:39:23 UTC
From: ka3nam
Topic: 11243 Message: 11243

Hi all,

My TS-850S started the ALC oscillation thing and I ordered a board from PacParts, installed it and the -6v is now solid... In the aftermath, the ALC now pegs (max's out) in transmit mode (SSB/CW/AM/FM) no matter what the carrier or power control settings are... The rig transmits fine (70-80w) and the scope and spectrum analyzer and scope look clean... So, this looks like an ALC sample issue to me... Curious if anyone else has experienced this. Any guidance is appreciated. Now, back to the service manual (p 123 & 124)...

-Joe

Thanks to everyone for info on keeping these great radios working.

Just read the wiki on caps and it says that the problems started in the late 1990s. Has anyone had trouble with Kenwoods build before that? I have a Kenwood 690S from 1993.

Thanks,
Dan

Topic: 11240 Message: 11250

I removed the file on battery replacement because it referred to soldering leads on a lithium battery. This is never done as it damages the battery and can explode.

Clif

Good point and thanks for the warning. When I do this job I will make my
own write-up - I plan to use a battery holder.

11255. Tune 160 meters

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-04-04 23:59:17 UTC
From: n0oer
Topic: 11255 Message: 11255

I just got a TS-450s and it will not tune my Long Wire on 160 meters, however the TS-440s I was using will. This is using the internal swr meter and a external meter. My friend who also has the same type radio and his won't tune it either. Any suggestions?

Neither the TS440 nor the TS450 internal tuner will work on 160. Both are 80-10

Section 4-9 of the manual states

"2. This autotuner does not function in the 1.8Mhz band"

I don□t remember the 440s ever working there either.

11260. TS-450 No TX audio on SSB

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-04-05 05:00:42 UTC
From: ah6rr1
Topic: 11260 Message: 11260

Had a buddy call me today and said his 450 died well just the Transmit audio on SSB. It receives just fine and has full output on CW just no TX audio. I looked trugh the messages and did not find anything close to this problem. Has anyone had this happen before? If so what was the cure? I would like to know to help him get back on the air as soon as possible since he has cancer and is hamming as much as he can with the time he has left.

Roland AH6RR

11261. TS-850 CAT Control PLEASE HELP!!!!

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-04-05 12:34:27 UTC
From: ei3gsb
Topic: 11261 Message: 11261

I'm tearing my hair out with this issue. I previously attempted CAT Control of my TS-850 using a G4ZLP interface and got nowhere with it.
I've just received a cable in the post this morning from ebay seller "affordableradio" and have hit the same problem, I can't get my rig and PC to talk to each other.
I installed the drivers as directed, selected COM23 (according to the device manager), tried a USB hub, tried a USB port on the PC, selected the various combinations of DTR RTS, rig is not in memory mode, I've done a microprocessor reset.

Can anyone help me with this problem? I have absolutely no idea what the problem is why I can't enable CAT control.

MTIA,
Andrew

i do not know if i can be of any help but will try. i have 2- 850's
2- 950;s and a ts 870 all using ZLP interfaces. so lets see what we
are working with first.
1. what software program are you using dxlab hrd ?
2. are u using a computer with com ports or usb ports ?
3. what are you setting the parms at ? 1400 8 n 1 ? for kenwood
the 870 uses a 9600 baud rate the 850 must use a slower baud rate
some programs let you set this. and the 850 needs 1400 baud 8 bits
and N parity and 1 stop bit. some programs just list the radio type
as kenwood fast or kenwood slow.
give us a list of what your setup is and some of us may be able to help

Do you have Ham Radio Deluxe installed? If not, you should get that
freeware program.

There is a feature, 'Auto Detect' that scans your computer for the correct
baud rate, com port, etc,

Which com port are you using?

I have 3 of the 'ZLP interfaces here and they all work fine. 73

i do not know if i can be of any help but will try. i have 2- 850's
2- 950;s and a ts 870 all using ZLP interfaces. so lets see what we are
working with first.
1. what software program are you using dxlab hrd ?
2. are u using a computer with com ports or usb ports ?
3. what are you setting the parms at ? 1400 8 n 1 ? for kenwood the 870 uses
a 9600 baud rate the 850 must use a slower baud rate some programs let you
set this. and the 850 needs 1400 baud 8 bits and N parity and 1 stop
bit. some programs just list the radio type as kenwood fast or kenwood slow.
give us a list of what your setup is and some of us may be able to help

I also am running my TS-850 with the USB to serial converter from Affordable in Win XP. I am running Ham Radio Deluxe (latest version). I looked in the Device Manager and it lists the working port as "Prolific USB-to-Serial Comm Port" with an address of Com8:. It is running at 4800 baud.

On other USB devices I've installed on my computer, manufacturer's instructions always ask you to install the software device driver BEFORE attaching the device, otherwise Windows may install a default driver which probably will not work.

If you had the misfortune of being struck by this problem, you can roll-back the device driver from the Device Manager window, disconnect the USB cable, re-install the Prolific Device driver provided by the supplier, re-attach the USB cable and you should be good to go after RESTART of the system. Also power-cycle the radio so that it connects anew to your computer.

Although I cannot see it today, I've been asked to handshake on both RTS and CTS for the Kenwood before when using the Affordaable USB to Serial converter.

Possibly correct procedure for Win 7 may be a bit different. I am not sure although I have configured and run my 850 from a laptop running Win 7 sometime in the recent past.

Good Luck & 73,
Mel - KF6OZ

Hi all,
One thing further...perhaps it would seem obvious but if you have a DSP-100 attached to your TS-850, the DSP-100 must be powered on for a remote connection to be made from your computer. This could trick one out as the radio is largely functional with the DSP attached but not powered on.

Hi Andrew

Does the USB cable use a serial port? I know on my WinKey setup, I have to have the comport set to the right one.

You can go to device manager, click on comports and see which one is assigned to the USB cable. 73
Tom W7WHY

I'm using the following...

Kenwood TS-850S/AT
Ham Radio Deluxe V5.0 build 2893
Dell Dimension 9150 PC running XP SP3 using USB to rig cable by ebay seller 'affordableradio' This is the actual cable...
http://www.ebay.co.uk/itm/180845062525?ssPageName=STRK:MEWNX:IT&_trksid=p3984.m1497.l2649
USB driver installed as per instructions on ebay

Anything else you need to know?????

Andrew

Right, I have it working now. The important detail that no one has mentioned is to ensure that NO interface power or flow control options are checked when connecting in HRD. It doesn't matter a whit whether software is installed before or after connecting the cable, port number is not of any consequence to correct operation.
Don't get hung up on the Port issue like I did, the essential part is outlined above...

Andrew

Just to clarify about the Port number, obviously it IS of consequence but what I meant to say was to select 'Auto Detect' for both Port Number and Speed in the 'Connect' dialogue. If you really struggle to make any configuration changes to your PC then let HRD do the hard work of finding which port your CAT cable is on...

Yes. The pinout is shown in the manual somewhere. I believe the connector is a standard DIN connector. I use it for the audio I/O for digital (aka soundcard) modes.

Hi Roland,

I'm no expert, and have not had this problem... however I would open the radio up and start looking for capacitors that have leaked. Take a look in the files section of the yahoo group, in the TS450 folder. There are some docs in there that will help you identify the ones that are know to leak (and some other common problems with these rigs). I would also take a look at the memory battery and see if it has leaked.

Could it be something simple like mic gain not turned up, or a bad mic?

Sorry, that's all I've got. Hopefully one of the gurus will respond :)

Have a nice weekend and good luck!

I will take a stab,

Has he confirmed that it is NOT the mike itself. Has he recently added a sound card device, that may be mute the front mike jack. Does he have another mike, or a local hams radio to swap out

Does it work with a sound card device., does it key in cw with full output

Does it key in fsk mode???

Since every board (almost)in the radio has an R180 can we get a clue which one?

11283. TS850 JEZB firmware?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-04-12 00:15:10 UTC
From: tom@k6aet.org
Topic: 11283 Message: 11283

By any chance does someone have a copy of the JEZB firmware for the TS850? Its IC18. A friend of mine is modifying the firmware to add some support for HiFi AM. He's already managed to tweak the JEZA firmware to support it. Even bought a second digital board in the hopes that it came with the JEZB firmware but no luck...

Thanks!

I was tired after work so I mistakenly thought he said No TX Audio it turned out to be the RX audio and I replaced C104 on the IF board after cleaning the board good. All is fine now and working 100% thanks everyone. I guess I need more coffee through out the day :-).

Roland AH6RR
PS I picked up a Virgin TS-850 and PS-52 yesterday in the mid 60mil serial number range for $500 Now I need to save my pennies to send my other 850 to Clif for a complete tune up since I do not have the proper equipment to do it myself.

Hello first post.
I picked up a ts-450s at a yard sale had been in storge 8 to 9 years,it has good rec and output Ant tuner working. After about 45 min.to an hour being turn on the display gos blank with just dots no #s,and giving a alarm in morse of UL UL UL.
I have reset radio and after it sets for about 15 to 20 min,it will go back to working for another Hr. From reading messages on here Im thinking may have leaking caps. Needing info on where(what board)to start looking for problem,and what caps may be bad.

Thanks

11293. Can't move AT-450 Ant Tuner from one TS-450 to another

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-04-20 21:38:03 UTC
From: drelectrode
Topic: 11293 Message: 11293

I've got a perfectly functional internal AT in one TS-450 but I'd like to transfer it to another TS-450 that has been upgraded with International filter (which I love) and has been aligned. The Rig that the AT is currently in is a bit deaf on the high bands.

When I installed the AT in the second rig, I connected the necessary cables, cut the W5 jumper, enabled the AT in both menus 31 & 32, and pushed in the auto button, nothing. No clicks, pops or otherwise acknowledgement that the AT was in there. On the filter board, relay K15 is not getting energized and there is no voltage on pin 6 of CN6 of the filter board when I tested it. All cables have been checked and reseated.

I put the AT back in the original rig and it still works fine. What am I missing?

Thanks,
Larry N3OJD

Many of these headsets have a small condenser microphone (I know it is really a capacitor thingy, but that's what I remember them being called). They are very high impedance microphones, so they have a transistor amplifier needing the voltage.

Others are condenser microphones that need bias voltage.

Still others have electret microphones (sort of a permanently charged capacitor design).

In any of these cases, a blocking capacitor won't let the power for the amplifier or bias for the condenser microphone get where it needs to go.

(I made this up from whole cloth -- but it is likely what's happening ;-))

From wikipedia article on TRS connector:

Computer sound
A 3.5mm plug for computer audio

Personal computer sound cards from Creative Labs, Sound Blaster or compatible to these use a 3.5 mm TRS as a mono microphone input, and deliver a 5 V polarising voltage on the ring to power electret microphones from the card manufacturer. Sometimes termed phantom power, this is not a suitable power source for microphones designed for true phantom power and is better termed bias voltage. (Note that this is not a polarizing voltage for the condenser, as electrets by definition have an intrinsic voltage; it is power for a preamplifier FET [transistor] built into the electret microphone can.) Compatibility between different manufacturers is unreliable.

Does this help?

The TS450 doesn't have an internal electronic keyer. Use a straight key or other external Morse generator (keyer, bug, keyboard, etc). My TS850S has an internal keyer but I still use an external keyer (WB4VVF Accu-Keyer), my computer during contesting and a nice straight key.

Hold down the Enter button and turn on the radio. This is the menu where you tell the radio what filters you have and IF you are running an AT300. If #1 is "ON" the radio is expecting an external tuner and the internal is disabled.

11304. TS-850 Having a hard time Tuning on 20m

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-04-22 00:07:34 UTC
From: kk4hho
Topic: 11304 Message: 11304

I have a TS-850 and it is failing to tune on 20 meters on a Off center fed Windome Invert V. Every other band is tuning fine. I had a TS-440SAT before and it was tuning 20m fine on the same ant.

Any thoughts? Car Control is at 12 o'clock too

Thx
Eric

Eric, You are comparing apples to oranges. They are different rigs and the test was done at different times. I would try making small changes in the feed line length or the antenna length. If you change only the feed line length, which I would try first, the SWR will be the same (as long as no other problems exist) but the L and C will change to possibly an impedance that the tuner can handle.Just about anything can change at anytime, for example, if the antenna was near a tree(s) and now since it's spring, it may have leaves on it where it did not last winter, so that can change things. The antenna is being effected by the ground, or nearby objects for that matter, which at one time were wet or covered with snow, and now they are not. Those are just examples. Try adding a jumper coax of a few feet at the rig and try again on all parts of the band. I've seen this B4.
 Let us know how you do.
73, Bob WE6C

Thanks Bob,

My antenna theory may be off but if a 440 with an internal at can tune
it and this very 850 was able to tune it before and nothing has changed
hence I put the 440 back on it and it tuned fine. I'm leaning toward a
radio issue and was wondering if anyone else had seen a 850 with at do this
on only one band before. The antenna is in the same place off a spreader
on my tower too

11307. Re: PC Headset

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-04-22 02:25:16 UTC
From: pauldebono@rocketmail.com
Topic: 11296 Message: 11307

The headset works excellent on my PC. I have checked the mic input connection of my souncard, by inserting a bare 3.5mm jack plug, and found that 4.5 volts are present on the tip. So I tried biasing the tip and took the audio out (via a capacitor) from here. On the mic jack of the headset, there is a direct short between the tip and the ring.

> Personal computer sound cards from Creative Labs, Sound Blaster or compatible to these use a 3.5 mm TRS as a mono microphone input, and deliver a 5 V polarising voltage on the ring to power electret microphones from the card manufacturer. Sometimes termed phantom power, this is not a suitable power source for microphones designed for true phantom power and is better termed bias voltage. (Note that this is not a polarizing voltage for the condenser, as electrets by definition have an intrinsic voltage; it is power for a preamplifier FET [transistor] built into the electret microphone can.) Compatibility between different manufacturers is unreliable.

Do you have an external tuner so you can get the SWR down before trying to
tune it with the '850? I know the tuner in my TS-450 won't tune if the SWR
is more than 3:1 or so. 73

Eric, It sounds like you made a good A to B test. I still would like you to try to add something to your feedline and see what happens. Maybe Clif here can give you more info than I.
Your know what's interesting is that the paperwork with radios usually says that they will tune an antenna that has an SWR of 3 to 1 or less but I have found that at times they tune a much more mis-match than that.
Keep on testing because we all learn from it. What's interesting to me is that your 850's tuner is working but just not tuning what your 440 is. This is where we need Clif to give us some more info.
Keep trying.
Bob WE6C

Everyone that has responded in reference to the voltage issue is absolutely correct. The microphone you are using is some type of condenser microphone which does need voltage in order for it to function properly. Yes I am not mistaken 1 of the pins and it in the kenwood does supply 5 volts. How to get it in your case I'm not exactly sure but you are on the right track at least. Please post to the group how you got it functioning when you do.

Aloha All,

I have for trade ONLY a Kenwood TS-850Sat with the Inrad Roofing Filter costs $200 (No other Filters)it has the Mars Mod, the NB Mod and the Remote Memory Battery mod. This radio has been a workhorse for me for the last 8 years and has never failed me it is a mid 50mil serial number in a 7.5 out of 10 condition works 100% will have manual hand mic and power cord. Want to trade for either a TS-480Sat, TS-690Sat(must be late serial number) or a TS-570S radio must have manual/hand mic and power cord I want something with 6 meters since I have a SteppIR Beam that works on 6M. Let me know what you have.

I have a nice Kenwood AT-250 Automatic Antenna Tuner for sale - $190 includes shipping. See ad #373705 on eHam.net with photo.

Glenn - K4ZOT

11314. Wanted: TS-690 Mic Gain Pot w/ Knob

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-04-22 16:32:30 UTC
From: Bob - K2KI
Topic: 11296 Message: 11314

Hi all,
Bob de k2ki in Vermont here. I recently bought a TS-690SAT that got bumped and the Mic Gain Pot sheared right off. The original owner told me that the knob and shaft fell into his heating duct. (Bye-Bye).

I need the pot with knob. The part number of the pot R05-3462-05 and the Knob is part number K29-4682-14.

If you have one, please drop me a note offlist.

If you have the entire board that the pot is mounted to (part number X41-3170-00), I would entertain buying it provided the sticker does not shock too much! :-)

Of course I have checked all the usual sources that Kenwood suggests and they are discontinued and not in stock. I even did wide searches on the web using multiple search engines but to no avail.

Any help here would be greatly appreciated.

73...
Bob de k2ki

Hi Bob

I had the same issue with my TS-450 found out it was a low voltage on vco2 I adjusted the voltage to 5 volts and resolved the issue

Clif, His tuner will tune but just not on 20. My guess is that the impedance it sees it cannot tune which is why I think if he adds some feeline it will not change the SWR but may change the impedance enuff so that the tuner can tune it. Make sense?Bob WE6C

Yes but the issue comes and goes which is what leads me to believe it is a radio issue. Sometimes if I go thru the bands and come back to 20 hit Tune and within a 10 secs its tuned. Other times I turn the radio on tune to 20m hit tune and swr goes up and down then it beeps and I shut off AT and change bands. I understand the issue of different tuners but I have run this antenna on couple other radios to see how well I built it and all internal tuners have successfully tuned it on all bands.

I am investigating the final oscillation issue right now ... unfortunately power spike during the storms this weekend managed to do in my O-Scope and a couple other electric items in my house so I may need to just bite the bullet and send it in for a good going over.

After all I traded a TS-440 and some other stuff for it

Eric

If it changes the impedance, it will change the SWR (which is not to say that it would be a bad thing). If he cannot match the impedance the way it is, then he needs to change it.

On Mon, Apr 23, 2012 at 11:45 AM, Bob Naylor wrote:

Clif, His tuner will tune but just not on 20. My guess is that the impedance it sees it cannot tune which is why I think if he adds some feeline it will not change the SWR but may change the impedance enuff so that the tuner can tune it. Make sense?Bob WE6C

2 different tuners.

Try tuning into a dummyload. If it doesn't do that then it's probably a relay. If it tunes the dummy load there is something about your setup it doesn't like. Look at the SWR on the internal meter??

Again, what does it do into a dummy load? If it's the radio it will have problems there also.

11322. No ALC or Compression Indication on Meter

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-04-24 15:29:49 UTC
From: acbreller
Topic: 11322 Message: 11322

I am recently not getting any indication of ALC or Compression on the meter of my TS-850 when transmitting. The Processor is working and when mic gain and processor are increased, I get increasing volume in the monitored audio. Also power out increases. Have an AL811 amp in line but not turned on. Have not made any recent adjustments to the ALC pot on the amp either.

Any thoughts?

Chris - KJ6ZH

What is the power out in CW mode on 20m into a dummy load?

From: m6gbt
Topic: 11324 Message: 11324

Hi
Just joined the group, Hello to everyone

I have a TS450S and getting high ALC reading going well over the scale, it can be turned down but audio output is next to nil with the car and mic gain turned down low. Having looked on Google. Apparently it seems a common problem. Does anyone have a suggestion to fix it correctly giving clear audio with output wattage , some say alter a pot in the rig?

This happens with the standard stock mic and also an icom SM8 desk mic. The base mic has been reported to have fairly low output on Fm.

Thanks
Pete

Hi all,

Thanks Pete for bringing this up!

I have this same problem with a TS450SAT and a Heil Goldline GM-4 in either wide or DX position. I have just accepted it and have not received any "bad audio" comments -- but then I mostly "do contests" -- where many stations' audio is pretty bad. I would also love to hear all responses to mediate this problem.

11326. 450 DISPLAY COLOR

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-04-25 02:46:50 UTC
From: Paul - K8IDX
Topic: 11324 Message: 11326

What color is the display on your TS-450? Mine is yellow and red. The reason I am asking is that I keep seeing pictures of TS-450's with blue and green displays! The color is similar to the blue color on a TS-440 display. My display looks nothing like that. Did Kenwood make some 450's with blue displays and others with yellow displays? Is there a hidden menu that selects the display color? Is my display dying and just looks weird? What is going on? This is just the kind of weirdness that drives me crazy. Any help or history would be most appreciated.

Thanks and 73,

Paul - k8idx with a yellow 450 display

I knew it! The only part of my display that matches yours, or the
picture, are the red parts. Everything else is a bright yellow. The
filter designators are a slightly greenish-yellow, but still not like
the picture. In fact I would not even say the red parts are the same
because they are a slightly orange-red. I have done searches and I can't
find any data on a yellow display on the 450s. I don't mind the colors
on my 450, I just don't want to find out that the display is about to
croak. Is there anyone else out there with a yellow display or am I the
only one?

Thanks for the info Josh,

11329. Re: No ALC or Compression Indication on Meter

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-04-25 14:00:14 UTC
From: acbreller
Topic: 11322 Message: 11329

Full power in CW mode and 80 watts in SSB. When I increase mike gain and processor gain in SSB mode, power out responds and I get increased volume and compression in the earphones when the monitor button is selected. Can even hear over compression if the processor is turned up too high. So it appears that the mike gain and compression is working. Somehow the meter is not indicating ALC or Compression. Meter's ALC is needed for digital modes to verify that gain is not too high.

Last request, "What is full power out in CW mode into a dunmmy load measured with an external wattmeter"????

Clif

--- In TS-850_450_690@yahoogroups.com, "acbreller" <kj6zh@...> wrote:
>
> Full power in CW mode and 80 watts in SSB. When I increase mike gain and processor gain in SSB mode, power out responds and I get increased volume and compression in the earphones when the monitor button is selected. Can even hear over compression if the processor is turned up too high. So it appears that the mike gain and compression is working. Somehow the meter is not indicating ALC or Compression. Meter's ALC is needed for digital modes to verify that gain is not too high.

The Processor is working and when mic gain and processor are increased, I get increasing volume in the monitored audio. Also power out increases. Have an AL811 amp in line but not turned on. Have not made any recent adjustments to the ALC pot on the amp either.

Nicotine. I've seen it several times.

Clif, I don't smoke. When I got the rig it was second hand but it had no signs of smoking like the smell which is easy to detect for me. Do you have a theory as to how this happens? I thought the display is a vac/florescent in a glass envelope. Is there a way to remedy this? Can the glass be cleaned? I guess most importantly how does this effect the longevity of the display? Is it going to die in a few months?

I just took the cover off of the rig and sniffed around and I don't get even a hint of nasty tobacco smell, which is an unpleasant and powerful odor to me. Someone must have done a very good job of de-odorizing it.

Thanks Clif,

Paul

The best clue is if the covers have a bronzish tint. I don't smoke either (anymore) and it's easy for me to smell it but I have seen radios that were smokers with no smell.

The display is probably fine. It has a glass front that needs to be cleaned and then the plastic reddish insert in the front of the radio. Be very careful cleaning it, it scratches very easily.

That is very good news indeed. Thank you Clif. So I assume I have to remove all of the knobs and the plastic front panel to get to the display, or is there an easier way?

The covers do have a VERY FAINT bronzing effect but it is so faint that I could almost be imagining it. They look silver to me. I guess the person who cleaned it did a very good job. If you hadn't mentioned it I would never have noticed the bronzing. I just wish the guy I bought it from would have been up front about it. I don't like smoke smell but it would not have stopped me from buying the radio. I am not one of those people who won't allow smoking in my house. If someone visits who smokes I am not going to make them go outside to smoke a cigarette. Now cigars if cheap enough can give me a headache but only if they are cheap enough. Hi. At least in spite of his smoking he took very good care of this rig. There isn't a scratch on it and it looks almost new. It sits on top of an IC-7600 and next to an FT-2000. I am just as likely to turn to the 450 as any of the other rigs on my desk. It is a FUN radio. I can't wait to get the display back to normal. I'll clean the display and I'll post the results and any caveats I discover.

Thanks for the good news. I really like this rig and I have installed a TCXO and filters so it's performance is very good now. I would have been very disappointed if you had said that the display was permanently damaged.

73 Clif,

Clif,

I just took the front panel off of my 450 and cleaned all of the display parts with ROR which is a very highly respected lens cleaner used by pro photographers. The display needed cleaning and now it is much sharper but it had no effect on the color. You mentioned a red filter. There was no red filter on my radio. Apparently Kenwood made some 450's with yellow displays or there is something else happening that would cause the display to change color. The front panel has a smoke colored and slightly bluish filter/lens on it. I looked at the exploded diagram and it shows only the parts I found on my 450. In other words I doubt that someone had it apart and left a red filter out when they reassembled the radio. I wonder if a red filter would make the display appear blue. I also noticed that it is NOT a vacuum/florescent display like I thought, it looks like it's an LCD. Anyway, I thought you would want to hear what I found. I guess the florescent tube backlight (bulb) could be going bad and have changed color but I somehow doubt that. I certainly hope not. So the mystery lives on. I just hope my 450 display does the same.

Thanks for your help Clif,

Paul

Here is a picture of a 450 (not mine) that has a display that looks
exactly like mine. It is comforting to know that I am not the only one.
I just wish I know what the story is. Too bad asking Kenwood would be a
waste of time.

Anyone see a rig like this?

From: avvidclif
Topic: 11324 Message: 11345

In CW Mode as you turn up the carrier does the ALC first dot light when the radio reaches 100w? If not probably someone has been in the alignment menu. You will need an audio generator with a calibrated output to set it correctly.

11347. Re: [TS-850_450_690] Re: 450 DISPLAY COLOR Picture of yellow display

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-04-26 18:58:34 UTC
From: Paul - K8IDX
Topic: 11324 Message: 11347

Thanks to everyone who replied to say they have a 450 with a display like mine with yellow and red instead of blue and green, or to say the opposite. While I am sure that there are some radios out there that were stained by tobacco smoke like Clif has seen, there are apparently some rigs that have a yellow display like mine. So far no one has said that they have had any trouble with these rigs or have had a display that gave up the ghost on them. So at this point there is nothing to do except not worry about it. Unless someone can add any history or experience not already mentioned I guess it is time to close this thread. Of course if you have any useful info on this subject PLEASE say so.

Thanks Clif, Chuck, Bill, Kurt, Bud, Roland, Jordan, Dave, and Pete for all of your help. It is comforting to know that there are others with the same version of the 450 and I am not alone with mine.

73 to all,

Paul - k8idx

P.S. if I left anyone out, please rest assured that I appreciate your help too.

100 watts output. This constitutes full power.

> --- In TS-850_450_690@yahoogroups.com, "acbreller" <kj6zh@> wrote:
> >
> > Full power in CW mode and 80 watts in SSB. When I increase mike gain and processor gain in SSB mode, power out responds and I get increased volume and compression in the earphones when the monitor button is selected. Can even hear over compression if the processor is turned up too high. So it appears that the mike gain and compression is working. Somehow the meter is not indicating ALC or Compression. Meter's ALC is needed for digital modes to verify that gain is not too high.

11351. Carrier board for ts-450

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-04-27 16:05:41 UTC
From: ka3zvc
Topic: 11351 Message: 11351

Hi All

I am in need of a oscillating coil part number L30-0201-05 not able to locate one from Kenwood dealers. Seems to be discontinued, does anyone know of a suitable replacement part or maybe have a complete carrier board x50-3160-00

Thanks

Skip (KA3ZVC)

11352. Kenwood MC50

Does anyone know the CORRECT wiring pin outs for a Kenwood MC50 mic for a TS450s. I have the MC50 diagram and never saw anything like it before

Thanks
Pete

FWIW it is also used in the TS820 Car 1 and Car 2 boards. Might be easier to find one of those.

Clif

Topic: 11352 Message: 11356

Take a look at a ts820 manual, for which the mike was made for (and others of that era, it should show the mike wiring of the 4 pin, then you can convert to the 8 pin wiring in the 450 manual

If the connector has been already removed, then you may need to find the mc50 manual to find which colour was on which pin

Pete,

I sent you a wiring diagram directly to your personal e-mail address since the reflector will strip the attachment.. Rather than rewire the MC-50 cable I would make a short adapter cable with a 4 pin male and 8 pin female connectors so you can use the unmodified mic with the TS-450 (and other Kenwood 8 pin radios). That also preserves the MC-50 for use with Kenwood 4 pin radios.

Good luck!

11358. 850 "pinched" audio on 80m

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-04-28 13:08:35 UTC
From: kk4hho
Topic: 11358 Message: 11358

Hey Everyone,

I have a TS-850 and I keep hearing I have very pinched audio (like I have a clothespin on my nose). At first we thought it was RF and I built a choke for my off-center fed and it improved but people still think I have compression on. Proc is off and I did a reset on the radio. With Monitor on I sound fine

I keep being told to find someone that knows how to setup the radio so I am reaching out for any tips or where to start. I just got the radio and I only have the stock hand mic connected

Thx
Eric

11359. TS-850 receiver overload?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-04-28 14:47:56 UTC
From: Kurt Cathcart
Topic: 11359 Message: 11359

I'm having a little bit of a problem with a new to me TS-850. Everything seems to work well except the receiver seems to overload way too easily. Strong stations (S9, S9+) seem to cause interference from as far away 20 to 30 KHz. I have a full complement of SSB filters down to 1.8KHz. This even happens even with the DSP-100 set to the most narrow settings.

Right next to the TS-850, I have a TS-450 that does not seem to have this problem using that same antennas and not using the DSP-100.

Does anybody have any suggestions?

From: pjansen48
Topic: 11367 Message: 11367

Hello,

My TS450 will not go into transmit mode. Not with the Mic or front panel "send / receive" or via MMTTY. It just stays in RX and never skips beat as far as receive goes (just like as if you were pressing the mike switch with the mic unplugged)

Before it totally stopped transmitting, MMTTY would send the TX signal to the radio and the radio would ignore it. Then several seconds after MMTTY went back to RX the radio would kick into TX and stay in TX until I switched the power off.

Now, even with just the radio alone - with no computer connected - it totally ignores any attempt to get it to go into TX.

Any ideas?

Thanks,

Paul / NO9C

I noticed that my 450 will do exactly the same behavior if there is a PTT or other transmit signal condition when the power is first applied. I have a mike that has a push on push off xmit key that I never use. I guess one of my cats walked on my desk and stepped on that switch locking it in the xmit position. I thought that the rig was broken until I finally found that switch depressed. I had to remove the xmit signal and cycle the power before everything worked again. I know it's a long shot but the behavior matches perfectly.

Good luck, 73 de Paul - k8idx

Don't know if you ever got this fixed or not, but you have to make sure
to set the menu to allow the '450 to transmit.

Hold the LSB/USB key and power on.

On menu item 19, make sure it is set to off (that seems weird when
looking at how it is worded. Off enables transmit, On disables transmit).

I have had my menu settings get reset by themselves before. 73

The MC-60 had a battery powered preamp and a 4 pin mic connector. The MC-60A had a preamp with power from the transceiver or the battery and an 8 pin mic connector.

Main difference was the 4 pin vs 8 pin connector.

Clif

11374. Re: TS450SAT Not going into TX...

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-05-03 12:55:49 UTC
From: pjansen48
Topic: 11367 Message: 11374

Thank you to all who replied...

I think what was going on, was that even though I had unplugged the "computer control" cable to try and narrow it down, I neglected to unplug the PTT/FSK cable on the rear of the unit. (I sort of forgot about that one...)

It seems like there was some issue with the level converter/isolation adapter and/or the LPT port on the computer.

The voltage levels on the 25 pin connector on the rear of the computer didn't seem right and I could not resolve the issue. So I made use of one of the 9 pin COM ports (that I had been using for rotor control). I then also replaced the opto isolator chip in the converter and now it seems to be back to normal. Hopefully it will stay that way - either that, or it is an intermittant problem of some sort...

Thanks again - 73,

Paul / NO9C

11379. No HF power output all of the sudden on 690SAT

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-05-17 01:05:50 UTC
From: aa5te.kb5ehr@gmail.com
Topic: 11379 Message: 11379

I went from 100W to 0W on HF on my TS-690SAT. 6M still works just fine, but HF, not so much - maybe 1W on 10m now; happened all of the sudden a few months back. I hadn't fired that rig up for months on HF. I finally turned it on, went to 10m, put her in auto-tune, and noticed I had a high SWR (3.5:1 or so on all 3 bands, so maybe a bad 10m trap or something, water in the coax, IDK) on my tribander. Went to all 3 bands to determine this. So, let it retune on 10m, cranked the power to 100W key down, about 5 seconds elapse, then POOF, essentially no power on HF. Receive is fine, no smoke or smell, allowing it to cool down for 15 minutes yields about 1W on 10m, lower to nothing on 20m down. 6m, as I said, still works fine (6 has always been a little flaky - power jumps at times, power fluctuates somewhat between 40-50W it seems. Did a microprocessor reset and some more fiddling, still the same. Kind of odd, though, because at first I could get almost 10W of reflected power now but only 1W out, both on the Kenwood meter and my external meter (harmonics? Not sure, but really weird). Switched coax around, still no dice. Fiddled with carrier, ALC and power settings, nada. Also, the current draw correlates well with those findings.

I found that D11, the surge protector had failed, but it may have been that way before this happened. Removed it, no change. No other charred/abnormal components have been noted thus far. Pulled the filter board to look at the finals, the finals IN CIRCUIT check out OK with my meter as much as I can check them without pulling components (~8 ohm B-E, E-B; B-C 0.472V drop).

Any suggestions on what to look at next?

11380. TS-850 display light out

HI Chris

Have you tried ti with a different power supply, or a battery.

Also, check the fuse holders in the power cord. Sometimes the fuses get
loose, or some crud can get in there. 73

Subject: [TS-850_450_690] TS-850 display light out

help. anyone know where i might start looking for the problem?

my TS-850s has been working 100% until just the other day. i turned it on,
and with in a min or so the backlight started to fade out to black (dark).

its been a few days now ,but it does come back on intermittantly now and
then, usually right after turning it on but then soon fades out again.

any suggestions please.

thanks, chris / ab9qb 73's

11383. Inrad filter install problem on TS-850S/AT

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-05-22 10:27:24 UTC
From: ve3mij
Topic: 11383 Message: 11383

Hi Guys! Great group, I have found it useful. Did a search and couldn't find an answer to my problem.

Installed an Inrad 400 Hz CW 8.83 MHz IF filter and with the 455 filters wide it seems to work fine. But if I select a 455 kHz IF side 2.7 KHz, or 500 Hz (Kenwood) filter, nothing seems to get through.

If I don't have the Inrad filter selected, the 455 kHz filters work fine. It almost seems like they are not matched up in where they are filtering, so when both enabled they block everything.

Any thoughts?

Bought the rig a month after they came out, and still love it! Only replaced the display cap so far, checked the caps on the DDS board and they are still happy.

73

Hi,
Please be careful that the slope tuning is wide open (maximum
bandwidth) when switching filters or you can get the symptoms
you have observed.
73,
Mel - KF6OZ

11386. Recording own TX audio

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-05-22 20:44:10 UTC
From: ei3gsb
Topic: 11386 Message: 11386

Hi,

Is it possible to record my own audio while I'm transmitting on my TS-850S? I was talking to a friend the other day who is into hifi audio and I had no problem recording his audio and playing it back to him. However, I thought to myself 'how does my audio sound?'. Obviously I'm aware of the monitor function on the 850 but I'm not certain that what I'm hearing is an accurate reproduction of my transmitted audio.
So... any suggestions as to how I can record my own transmitted audio??

Andrew

Thanks Mel, you nailed it!

I thought I had it wide open, but it turns out I had it wide closed... (If there is such a thing hihi)

Guess I'm a little rusty on the controls. Just getting back in to using HF as I haven't for a few years. Great to know there's nothing to fix! (And that there is that kind of control with the slope tuning in CW!!!)

Really had me puzzled since the rig is DDS, if the mixer frequencies were off.

Thanks, Jim

I went ahead and did in circuit checks of all of the transistors on the PA board; they all appear to be fine. Now, I did notice that R6 and R7 are burnt but still reading the proper resistance (10 ohms; 15 in the manual) even though they're burnt. They slightly melted the insulation on two of the wires that were touching them. But everything else looks fine. Ideas?

> fine (6 has always been a little flaky - power jumps at times, power fluctuates somewhat between 40-50W it seems. Did a microprocessor reset and some more fiddling, still the same. Kind of odd, though, because at first I could get almost 10W of reflected power now but only 1W out, both on the Kenwood meter and my external meter (harmonics? Not sure, but really weird). Switched coax around, still no dice. Fiddled with carrier, ALC and power settings, nada. Also, the current draw correlates well with those findings.
>
> I found that D11, the surge protector had failed, but it may have been that way before this happened. Removed it, no change. No other charred/abnormal components have been noted thus far. Pulled the filter board to look at the finals, the finals IN CIRCUIT check out OK with my meter as much as I can check them without pulling components (~8 ohm B-E, E-B; B-C 0.472V drop).

Usually if there are burned resistors, it is caused by excess current through them. Something is shorted somewhere. I'd think. 73 and GL

Replace the drivers. 2 15 ohm resistors in parallel is 7.5 ohms. They are no good. Replace them also and don't forget to set the bias with the new transistors.

Thanks, Clif! The resistors read 10 ohms (out of circuit) but should be 15 ohms each. And I noticed something that I had not paid attention to before. The solder on the drivers was newer looking than anything else on the board, with more flux residue on the PCB around the leads. And they were clipped off (the leads didn't cover the entire pad). So, I pulled them. Diode checks both show base-emitter completely open, and base-collector on one of them at 0.32V drop, 0.62V on the other one. Also, the schematic calls out 2SC2509's; these are the newer 2SC3133's. So, it appears that these were replaced once upon a time before 2004 when I purchased this rig. So now to find replacements (ebay is looking like it for now, but 2 weeks shipping or more from China). Unless there are other equivalents that are more easily obtained.

Hi, about 8 years ago I bought a TS-850, it was only last year I noticed

there was no serial number on it.

Were these just stuck on?

I have the original bill of sale for it, but no serial number on it.

The serial number for the 850 is located on the back of the radio. Your original sales receipt should have the serial number listed, so you would be able to turn in the original warranty registration card. Additionally, the serial number is printed on the original inner shipping box.

From: n0rz1998
Topic: 11405 Message: 11412

I discovered that no ssb output can be caused by having the processor knob turned to zero with the processor on. I turned the processor off and had ssb output. I run a ts850.
I hope this is all that is wrong with your rig.

Hello Clif;
I finally got around to trying what you recommended. Life events got in the way and I also had to change the caps on the CAR board. Anyway, it didn't really solve the problem. After spinning the cap and resetting, the audio sounded only slightly better. I pulled the PLL board from my parts rig and that solved the problem. Does the trimmer cap in the LO2 circuit go bad? I opened up the cover and it looks like the LO2 board is raised off of the main board. It looks like it could be a hassle changing out the trimmer. Is there a way to verify it's the trimmer and not some other component? Thanks for steering me in the right direction. I was about to swap out the RF board and would have been very dissapointed.

You have to remove the entire sub-assembly and then change the cap. Be careful not to damage thru holes on the PLL board.

11415. TS-450S Receive problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-06-16 13:29:37 UTC
From: Dan Mattingly
Topic: 11415 Message: 11415

I have a friends rig that was damaged badly by high RF input. What happened was he was running the rig mobile. Another ham was running the same band he was but, not the same frequency. The other ham pulled up along side of him so the antennas were only about 4 feet apart. Not realizing the situation the ham keyed down and started talking and was using a linear amp. The 450 started to smoke so my friend turned it off. When he did turn it back on the receive was extremely low. I took the board out and found the lightening protection diodes burned out as well as there traces. I repaired that and I ordered a bunch of pin diode and couple of the transistirs figuring there had to be more damage and there was. I replaced all the front pin diodes on the bandpasses for 160 thru 20 meters. 10 meters was working fine with a S-9 singal with 50uv. All other bnads were at S-3 to S-5 for 17 meters. After replacing the diodes I now get S-6 from 160 to 15 meters and S-8 on 17 meters. Not sure where to look from this point as to the bad component(s). Perhaps the back bandpass diodes are weak and possibly leaking. They all checked good but, that isn't always the case. I also noticed several other switching pin diodes and wondered if they might be causing the issue. They checked good also. I'm now down to looking at the transistors in the circuit. Any ideas would be appreciated. It's a difficult board to trouble shoot with the major amount of compponents on the bottom of the board. I do have a 150MHz scope and a HP8921A service monitor so I can delve into the circuits without any problem. Thanks for your time.

11416. Excessive TX Phase Noise?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-06-16 20:24:09 UTC
From: Eric
Topic: 11416 Message: 11416

After repairing one of my 850s, thanks Clif, I noticed something unusual about the other 850. When transmitting, mike gain minimum, power minimum, CAR control maximum, I hear a carrier and a rushing type sound in a monitoring receiver. A wire is connected to the 850's antenna, no antenna is connected to the monitoring RCVR. The carrier and the rushing sound do not move the meter on the RCVR, but is fairly strong. With the recently repaired 850, with the same conditions, the rushing sound is not there and the carrier is very weak. I did adjust the null pots and the carrier was reduced, but only slighly. The rushing sound was still there. When transmitting at full power into a dummy load, the audio sounded fine in upper and lower sideband as heard on the monitoring RCVR and the receiver works. All bands are affected. When I purchased the affected 850, the suface mounted electrolytics on the CAR board were replaced by standard electrolytics. Should I replace the electrolytics on the CAR board with SMD devices, or should I look elsewhere? I don't have a spectrum analyzer. I do have a rather unstable signal generator. I suppose I could inject signals into the various TX mixer stages at the proper frequency to see if the noise goes away in an attempt to localize the problem. Any ideas would be appreaciated.

11417. TS-850S Tune button ?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-06-16 17:27:03 UTC
From: Joe Cotignola
Topic: 11417 Message: 11417

Hi All...how exactly does the "TUNE" button on the keypad work ?
The manual says that it emits a sidetone in CW receive mode, but, nothing happens when it is depressed. The TUNE light comes on in the Dsiplay area.

Are there any other settings that control this sidetone getting emitted ?

Thanks in advance

Joe WR2B

The TUNE button works in conjunction with the thru/auto button above it, where if the auto/thru button is depressed, pressing the tune button will TUNE the antenna as best it can. Not sure about a sidetone, cause the radio does not even have to be in cw mode to tune. All I ever hear (that I remember) is the little motors of the tuner whirring.

Also this also will only work if you actually have the tuner installed.

I think you're asking about the "tune" button on the keypad which shares a number button. This button can be used for zero beating CW signals and it can also be used for tuning. When the tune button is in, you can key the mic and get a carrier and the carrier level is adjusted with the carrier control. I use this to tune my antenna tuner and my amp. You can get from zero to approx 60 watts out this way.
When using the tune button for zero beating, you will hear the cw signal above and below the zero beat freq so between the two tones is your zero beat freq.Hope I explained this well enuff.
I hope you were asking about an 850. 73, Bob WE6C

thanks for the replies...the Tune button I am referring to is on the numeric keypad above the CLR button.
Problem is that when I press it I expected to get a low power signal so I zero the SWR with my antenna tuner, but nothing happens.
AM I missing a setting somewhere, some other function that needs to be enabled ?
I am using an Iambic paddle for the built-in keyer with the keyer swiych on the back in the ON position.

Thanks
Joe

Go to Ebay and do a search for G4ZLP. He makes some really good CAT cables and they are reasonably priced. I purchased 3 of them here - 2 for my Kenwood TS-450's and 1 for a Yaesu.

You can also Google 'ZLP Electronics. 73

Mark,

The DXLab Suite (free, and always will be) provides a full suite of programs that all operate independently, but also inter-operate and communicate with each other to provide a complete ham radio package geared toward DX activities. In its entirety it provides rig control, logging, award tracking, propagation forecasting , callbook lookups, QSL card or label generation, uploads to LOTW, EQSL and ClubLog, rotor control, digital modes (PSK, RTTY, CW, and can interoperate with other digital programs), spot analysis (with needed stations highlighted), etc.

The rig control program is called Commander and can be used stand-alone. But with such a wonderful suite of programs, you will likely want to utilize others (if not all of them). The suite was created by Dave, AA6YQ about 12 years ago and is continually enhanced to track user needs. Support is provided through an email reflector, and Dave personally addresses most questions personally within 24 hours. Actually, his goal is to actually FIX a reported defect within 24 hours.

I use the suite with my TS-450SAT, and my TS-440SAT. But it supports just about any rig that can be interfaced to a PC.

Check it out at http://www.dxlabsuite.com/ . Good luck!

Chuck, WA3CEJ

If you are referring to software to interface with the radio, or the interface itself.

If you already have the interface then it really depends on how you want to control it

Several software makers (free and the others) interface with the radio. Rtty programs jt65 programs, logging programs. So it really depends on what you prefer to do..

There are several sellers on Ebay that have them, just do a search on
"Kenwood amplifier cable"

Here is one as an example

http://www.ebay.com/itm/Kenwood-TS-830-TS-830S-Amplifier-Relay-Cable-With-ALC-/380447701394?pt=US_Radio_Comm_Coaxial_Cables_Connectors&hash=item5894733992#ht_2991wt_1185

11435. TS-690 does not power all the way up

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-06-26 21:41:29 UTC
From: Tim
Topic: 11435 Message: 11435

Traded for a ts690 not in my hands just yet but traded for it as is..Here is what it does when you power it up:Filter selection lights come on, and the LED backlight comes on, that's it. Give it a few minutes, and either it will turn on on it's own, or cycle the power button a few times. If it doesn't transmit when it comes up, then put a finger on the A=B button (full reset), and cycle the power button again. When it starts, it will come up on 14.000, and run fine.
Does this sound like a leaky battery or pll unlock issue?Thanks

11436. RE: [TS-850_450_690] TS-690 does not power all the way up

Yahoo group: TS-850_450_690 (2010 — 2016)

From: Dave Gmail
Topic: 11435 Message: 11436

Battery is only for memory backup, as far as I know, so I would say not dead battery, leaky, you can only tell that, but I don't kln ow its location, so I don't know if it would have the issue like the 850.

Almost sounds like a cap not working right away, and causing power to not get to where it needs to.

Pll unlock usually causes the display to blank or "go to the dots" as in the 440, and say UL in cw, and the display, or some indicator (check the manual)

I'll check the memory battery it may be leaking causing some trace damage,Or as you said a bad cap somewhere..

Have you verified your power supply is not at fault, maybe the regul;ator quit (was quitting) and this will cause the radio to not power up. It should have nothing to do with memory backup battery for powering up

Here is a short video clip of what the 450 is doing keep in mind that i have verified that the issue is on the control unit that holds the battery for memory back up,we switched boards from a known working unit..But here is what it's doing..A picture worth a thousand words so a video must be even better..I have looked and see no signs of bad solder joints no swelled caps etc..see what you think.

Good luck. I have seen about two of them for sale in the last 10 years or so. There was one about six months ago on QTH.NET. I would just start random Google searches. I happened upon one a couple of years ago, NIB. They are nice pieces of gear.

From: Tim
Topic: 11444 Message: 11444

I have a ts 690s and the rig works great but i see the alc go to full scale and decided to do a few tests and have found per the service manual that i should only see 2.5 volts on the alc test point pin 7 of cn-1 in the rf unit but i see 7.64 volts and vr14 has no effect at all and i think this is why my alc meter pegs with just a whisper.Any ideas or anyone else ever seen this issue?The rig gets great audio reports and puts out full power on all bands.Just the alc voltage is outta whack..Thanks

Hi Doug

If you don't find the board, I used a real small piece of coax on each end of the filter soldered to the pins on the plug. Seems to work OK. 73

11451. the 850 today

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-07-11 09:49:36 UTC
From: Paul Manuel
Topic: 11449 Message: 11451

Hi all,

I had a TS-850SAT a few years ago but sold it. Recently unexpected expenses came up and I sold my Yaesu FT-950. Now I am shopping for another radio and will probably buy an 850 that is being sold locally. It is a 5-million serial number.

I wonder what are everyone's thoughts on the 850 today? I really wanted something other than another FT-950, even though they often sell for only $100 more than the 850. Is the 850 still a viable rig? How does it compare with, say, the Kenwood TS-870, which sometimes sells for around $800?

My personal thoughts are that the TS-850 is one of the best all-around rigs ever made. The FT-950 worked well but I never really developed much "affection" for it, if that makes any sense.

Anyway, I'd just like to get some opinions on the TS-850 and how good it really rates today.

73, Paul K4PDM

I was going to say check out http://www.sherweng.com/table.html
But for some unknown to me reason the Yeasu in not on the list .
The Kenwood seems to have one of the best reps. on air sound quality .
I have played the Yeasu but not enough to be able to give a good review .
Next would be looking on this http://www.rigpix.com/

11454. TS-450SAT no tx on FM?

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-07-14 14:47:45 UTC
From: w4maa
Topic: 11454 Message: 11454

I looked back through all the post to see if I could find some information on this and came up with no additional info. The TS450 works fine on all other modes. SSB/AM/FSK/CW and receives FM but there is no ouput on FM. It shows it keys but no ouput or audio of any kind. I did the FM tx setting per the manual and still no dice. Has anyone else had this type of problem?

It does work on all other modes. Looking at the service manual it looks like FM works by bypassing some of the IF section and uses a relay? to bypass the path for FM. I think it is real FM if the circuit is correct. I have not had time to look at the full schematic yet. I will see what I can figure out. Mark do you know if there is a simple alignment of the freq counter to actual frequency? I saw something about TC1 as a ref oscillator is a 20mhz set but I have little info on getting the frequency to match the readout. Seem to be about 20khz high rx on all bands and 21khz off on tx all bands.

11457. Ts-850s keyer

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-07-17 09:39:36 UTC
From: Paul Manuel
Topic: 11454 Message: 11457

I recently purchased a TS-850SAT and the CW keyer does not work. It either does nothing when enabled or constantly keys.

The 5V is going to each paddle connection and does go to ground when I key the paddle, but it has no effect--the keyer either does nothing or keys itself shortly after turn on and stays that way. The 5V is present even when the keyer keys itself, so the line from the paddle and the jack are not shorted.

Is there a common failure I could look for? Where is the keyer circuit located (I think on the IF board but not sure.)

thanks 73 Paul K4PDM

Topic: 11454 Message: 11460

Gentlemen thank you for the advice on my keyer.

What I am saying is that the input on the paddle side is OK, with 5 volts on each paddle that goes to 0 volts when the paddle is activated. But the internal keyer always either never keys, or keys with a constant tone as if a straight key were locked down. It does this with or without the paddle connected.

I need suggestions as to what could be wrong with the internal keyer as I have ruled out everything external.

11462. TS-850 Another Capacitor

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-07-18 03:27:05 UTC
From: ve3xat
Topic: 11462 Message: 11462

Hey guys. I finished changing all the electrolytic capacitors in my TS-850 and found a bad one I thought I would share with you that could be a problem. C610 on the small digital board mounted in the power amp heatsink is a 22uF 10V 105C red Marcon capacitor. It read 0.89uF and had an ESR of 22.8 ohms! I know that is not good. There were several other small ones in the radio that were just starting to leak, you could see small black spots under them on the pcb. If your working in there you might want to check that one out. Good luck.
Mike
VE3XAT

P.S.
Took me 3 days to recap as I cleaned and lubed everything in there.
I think it was worthwhile as I love my 850.

Mike

Hi, Same as you did, i replace all electrolytic capacitor on 3 unit of my brother's TS850 and TS450 & TS690, its worth the capacitor overhaul all will last for another 10yrs? Also i have a friend who owns a HP communication service monitor, i had the TS850 re checked all the internal calibration based on the service manual.

I found atleast 1 or 2 electrolytic caps thats is already leaking aside from the known common caps to leak (DDS board, Display and Audio caps). Around 100 capacitors all in all are change.

Hope others will do also on their loved TS850/450/690 that they want to keep and use more in the future.

First I apologize for my bad English language..I am a HAM operator in a alnd with very high humidity abiut 85%.I have an 25 years old TS 850S,that is very rarely turned on.After many years I turn the radio on,and find some strange symtomps.First there is almost no power out on any mode,which is there again after warming up the radio.All power output in any mode seems to be ok now,exept in SSB.In SSB I get absolutely no power out,without turning the carier knob clockwise.(Zero output by Carier knob fully counterclockwise,exept if I switch the processor ON).I have replaced all leaked electrolyt caps in the carier unit,as Dave W6 OT,told us,but this symtom remains.I sometimes watch also that the cooling fan,first doesn't turn fast enough,by the transmit mode,but only at first...Now I see also that the build in antenna tuner doesn't function as well.It seems to be OK at the receive mode (with the thru/auto knob on),but at transmit mode it only works by certain position of the carier knob,is this normal..?Could somebody help me with this problem ?Btw I get only about 90 Watts,by full power.
Thank you so much from YB 3 RF-Kicky,East Java Indonesia.

If you have the TS-850 service manual on pages 129-130. It is the small board on the top middle. On the top left hand corner of the PCB you will see 3 capacitors(C608, C610, C607). It is the middle one. This board is mounted beside the power amplifier(final unit). Inside the heatsink assembly, Page 93 shows it well (digital X46-308)D/4. Good luck!
Mike

harold, there are 10 caps on the CAR board that are 16v / 10uF . then 1 on that is 16v /47uF. then on the display board there is 1 that is 16v /470uF lead type. all others are smd's and electrolitic.

The extended description of the capacitor kit says it includes replacements for all the capacitors in the radio, NOT including the external power supply and NOT including the SMD capacitors from the carrier board.

The kit on top is the one I bought and it did include the SMD caps , I
installed those almost 2 yrs ago .
Maybe send a email to the seller .
Or with the list , go to your local electrical supply house .
Also I saw lots of info suggesting upgrading caps , higher voltage & temp ,
but same capacitance .

> Hey guys. I finished changing all the electrolytic capacitors in my TS-850 and found a bad one I thought I would share with you that could be a problem. C610 on the small digital board mounted in the power amp heatsink is a 22uF 10V 105C red Marcon capacitor. It read 0.89uF and had an ESR of 22.8 ohms! I know that is not good. There were several other small ones in the radio that were just starting to leak, you could see small black spots under them on the pcb. If your working in there you might want to check that one out. Good luck.

It sounds like there's an opportunity to make some dough on a kit of capacitors that tend to go bad. We just need someone who knows what to order... ;-)

I'm about to do my capacitors in my 850 (20... serial number with old chips, hope they stay working). There is not much leakage that can be seen so I checked them plenty soon enough, just waiting for replacements to come in and building up my confidence in doing this. Watched a video, the guy makes it look easy anyway. The battery I will do some time later, it is not leaking anything and I didn't find any signs of any other problems anywhere...also the radio is working fine. I want to keep it that way!

The whole idea of replacing the battery is so that if it leaks, it is NOT going to destroy traqces on the board. While you have it apart, change its location, preventative is better than, shoulda coulda type repairs

Steve

Hi, just a tip on replacing the capacitors. Before you start to remove those capacitors in each board, put a dot mark on top of each capacitor using a marker pen. This way you can identify which capacitor you already change and to be change. Or you can color code same value capacitor so when changing them you can change by same value one after the other value.

This is an additional task but at the end it will benefit you, changing 100+ capacitor is confusing along the way especially when your working few hours straight to finish it board by board.

I use this technique on changing capacitor on 3 units TS850, 1 unit TS450 and a TS690. Even i stop and become tired, i can still identify and track which capacitor is done and to be change. It work for me hope you give it a try.

This might be totally incorrect but those numbers might only be date codes. Normally I have only seen them on ICs but those figures look like year and week. Is it possible they are that old and are there any other markings or logos on them?

11487. TS 850 capacitor Replacement experience

Use a set of paddles from MFJ or Bencher. I think now around a 100 bux. The switch is on the back for either electronic keyer or straight key. The keyer speed control is on the front. You also have the amplifier relay switch on the back that you can turn off if you're not using an amp. With the relay off, you don't hear the relay "clicking" when keying. No use having that relay operating when it's not needed, especially when using QSK.
You will enjoy one of the best radios ever made! I've had mine for just about 20 years and have no desire to replace it!

Hi, same on what i said to steve. I suggest to mark all capacitor to be replaced by a marker pen on top by a dot mark. With this you can track or follow your work what to change and what have already changed. Even you stop changing you can still continue without checking which is change and not.

I suggest you work 1 board at a time, mark all the connector you will remove so during re install you will not be confused where each connector goes. Carefull on removing the ribbon wire you may cut the trace. Another tip is you can take close up picture shot on each board as a back up, when you became confused on where those connectors were really plug in.

You will smell acid on a leaking capacitor when you desolder it. On my capacitor removal, i flood the 2 capacitor lead with solder lead when it both melt i pull the capacitor with a small long nose plier on the other side. Then proceed with a manual desoldering tool to clear the hole with solder lead or you may use desoldering wick also.

Take time in removing the capacitor its not an easy task, you need patience and time, also some technique. Along the way you will know how to remove it easilly as you go on. Remove one cap and resolder new one same value, with this you will not mistakenly solder wrong value at a wrong place.

I have done this to 3 unit TS850, so far after the change no problem encountered. Hope this helps.

Basically, Downeast Microwave, US company, unless you want to buy high-end German stuff. You can buy common IF units now which makes life much easier. They are probably going to run you in the neighborhood of $500 for the six meter unit and $600 for the two and 432 units. Add $75 to each one for common IF. You don't want split IF. $200 - $300 each for a brick amplifier. $400 - $500 each for two and 432 MM SSB preamps and your in business. :)))))) Oooops. Forgot the Heliax. Depends on the length of your run.

You might be better off buying a used FT-736 or an Icom 9410????? I think that is the one.

I have a TIB-850 which I used before DEMI came up with the common IF.
They aren't making them anymore to the best of my knowledge. Virtually
impossible to use with more than one transverter. There just isn't any
reason to buy one with a split IF on these bands that I can think of.

The TIB box was nice. You flipped it one way for your transverter and
the other for HF.

Basically, Downeast Microwave, US company, unless you want to buy high-end German stuff. You can buy common IF units now which makes life much easier. They are probably going to run you in the neighborhood of $500 for the six meter unit and $600 for the two and 432 units. Add $75 to each one for common IF. You don't want split IF. $200 - $300 each for a brick amplifier. $400 - $500 each for two and 432 MM SSB preamps and your in business. :)))))) Oooops. Forgot the Heliax. Depends on the length of your run.

You might be better off buying a used FT-736 or an Icom 9410????? I think that is the one.

You can to use the TS850SAT with SSB Electronic transverters, LT6S, LT2S and LT70S and if you want one LT23S for 1296 mhz with 28 Mhz FI...
And please, don't compare one TS850 with a transverter with one TS2000....

Those are great transverters. I don't think they have common IF
though. 20 watts output and they are only about $1200 US.

I had a tentec unit 1208?? Or 1209? Cant remember, but it was very limited
to only 8 watts drive and 8 watts output, if I remember.

Ot sure if they are still available, but I do see them on the used market,
usually around 100.00 or so.

My first QSO indicated I was off freq.
I'm newby to phone on HF, just acquired a TS-850S, which I like.
After I tune to RX someone's transmission for best signal, how/where do I tune for TX?

It should tune automatically to the correct frequency.

Make sure your XIT or RIT is not on as that will make your TX and RX frequency different. 73

Make sure your RIT is off and also the transmit RIT (forgot what they call it). Tune so the voice you are receiving sounds natural and you're good to go. Don't judge by one opinion, get on the air and get another opinion. Enjoy your new toy! In my opinion the 850 is one of the best radios ever made!73, Bob WE6C

TX and RX should be together unless the RIT or XIT buttons are pushed in. If the RIT or XIT buttons are pushed a red RIT or XIT will appear to the right of the frequency display. If one or both of these buttons are not pushed, the rig has a problem.
Of course, you can transmit on a frequency (such as 7255.00) and push the RIT button in and adjust to the frequency you are receiving from the transmitting station.

Checking your settings for the mode [as others have mentioned] .
The manual has initial settings for different modes , take a look to see where all the settings should be for phone .
The some history of your rig , ser. # there are some early rigs that had leaky caps , the most important are on the CAR board [very important could make the radio a parts rig] and may affect frequency discrepancies .
I have some similar issues and had better match after replacing caps .
My rig is still off slightly but have not gone through it to get just right yet .

With the RIT and XIT off, the frequencies should be the same. The only error I think you could make would be not to have the signal tuned in exactly right on receive. I've noticed with some people's voices it's almost impossible to tune them in correctly.

11514. Problems removing VFO knob, replacing pot on TS450S

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-08-12 18:53:22 UTC
From: Dean
Topic: 11514 Message: 11514

First a quick introduction as this is my first post:

Hello - My name's Dean and I just picked up a TS450S so that I can get back into HF after being away for a few years. Celebrating 20 years as a ham this year and I have always wanted a TS450.

Found what I thought was a good deal in the QRZ classifieds, but when I received it, the mic gain pot shaft was severely bent. There was no evidence of damage to the box, so it must have been that way before shipping. I tried ever so gently and slowly bending it back, but it immediately snapped flush with the potentiometer body.

So I set about disassembling the radio to get at the pot so I could order a replacement and found that the set screw for the VFO knob was stripped. Tried various things to get it to move, but ended up deciding to drill it out. I used a bit that is the same size as the existing hole, but the knob would not budge from the shaft. Tried one drill size up, and still no luck. I am reluctant to apply much force so as not to damage the encoder.

Any thoughts on how to get it to move? Also, anyone know of a source for a new mic gain potentiometer off the top of their head?

Thanks in advance.

Thanks Dave - Unfortunately, it looks like the pot is no longer available. Th VFO knob is $80, so maybe I'll make due with what I have for the time being.

Anyone have any tips for getting the knob off? I can't do anything until I get it off.

Thanks Dave - Unfortunately, it looks like the pot is no longer available. Th VFO knob is $80, so maybe I'll make due with what I have for the time being.

Anyone have any tips for getting the knob off? I can't do anything until I get it off.

73,

Dean - K7ADN

11520. TS-850S Attenuator Problem

Yahoo group: TS-850_450_690 (2010 — 2016)
Date: 2012-08-13 20:57:23 UTC
From: andrewburfield
Topic: 11520 Message: 11520

Hi all..
I Have just purchased my TS-850 and I am having loads of fun with it. One issue that is bugging me is that the received signal seemed to be weaker than my other receiver. Pushing the 6db attenuator button to the 'IN' position brings the signal up. The 12db attenuator button when pushed in drops the signal level as expected. Can anybody explain this behaviour? it appears that the button is working in reverse!?! Thanks Andy M0KVR

Sounds like one of the resistors put in and out of circuit may be changed value or open....

Happened to me

Hi I am from manila (also very humid here). I think the tuner needs a minimum amount of power so that the tuner will work. Other than that , i think your radio needs to be warmed up to get all circuits running. good luck n 73.

Funny... Just realised that the 6db attenuator works properly on AM reception. Also if attenuators are off I get AM broadcast breaking through on 17 and 15 meters..

Look in the cooling slots at the right rear of the top cover. If you see something real close it has a tuner, if it appears empty there is no tuner.

The attenuators are the first thing the signal goes thru on the RF unit. Mode has nothing to do with it. Most likely you have a leaky diode or 2 in the BPF section of the RF unit.

Hi Clif. I would say that my TS 690 has no auto tuner in it for if you mean to look in those 6 half round air vent slots top right and part down the side it looks empty, pity about that, I do have the manual tuner the Yaesu FT-707 so will have to use that, wonder how much a tuner would cost to go in that space, bad kenwod selling a 450 with and the 690 without. Hello first post.
I picked up a ts-450s at a yard sale had been in storge 8 to 9 years,it has good rec and output Ant tuner working. After about 45 min.to an hour being turn on the display gos blank with just dots no #s,and giving a alarm in morse of UL UL UL.
I have reset radio and after it sets for about 15 to 20 min,it will go back to working for another Hr. From reading messages on here Im thinking may have leaking caps. Needing info on where(what board)to start looking for problem,and what caps may be bad.

Thanks

You've already done my first suggestion -- "reseating" the connections. You've also already done my second -- "try another cable".

I wish I could give you some other ideas. You said it does not read frequency, but do other functions work at all?

Dan

Do you have the serial device on a usb to serial adapter, or direct to it's own serial jack???

Do you have HRD on auto, so it will check all ports and baud rates..
(although it should be on 4800)

4800,8,n,2

Maybe the usb devices re assigned it self

Subject: [TS-850_450_690] Re: CAT trouble.....Failed to read freq

You've already done my first suggestion -- "reseating" the connections.
You've also already done my second -- "try another cable".

I wish I could give you some other ideas. You said it does not read
frequency, but do other functions work at all?

Dan

Tried 2 known working cables the problem has just started after many months
of trouble free qso's using Ham Radio Deluxe B2893

Hello,

suddenly overnight, my TS-450S has a very low volume RX audio in SSB, cw and FSK only (on internal and external speaker/headphone), S-meter seems working correctly in SSB. RX AM and FM have the normal audio signal intensity and sensitivity. In TX, seems no audio in any mode (S-meter and swr-meter not moving). C104 was replaced but was not the cause (traces are not corroded). Squelch seems not the cause (ok in FM). Parameter reset and visual check of IF board were done. A PA was never connected.
Which circuit board(s) should be checked? Thank's in advance for a hint.

'73,
Rainer 7J6AAO/1

> > >
> > > I also have just pulled my old 450s out of mothballs and are having the exact same issues you have described. It started out with a "static crash" sounds in the rcvd audio (internally caused not atmospheric static crashes) then the volume would reduce noticeably until yesterday when like you, I powered the radio up and the audio would be there for a second and then the rf gain bargraph would go full scale and the audio would be gone completely if I turn the rf gain to zero and quickly back up to 10 the audio will come back strong for a second but the bargraph will climb rapidly back up to full scale again. Slowly as the radio heated up the audio would return and the bargraph would drop to normal with the exception that all rcvd signals would be at most s5 or no s reading at all...

Ok so I found a leaky diode (D16) in the BPF section of the rf unit. I ordered suitable RLS135 replacement diode but I have been sent RLS73. Are these a suitable replacement?

Kenwood doesn't show that as a sub. Where did you get it?
